

Advances in FM Antenna Technology

Presented By: Dave Benco

September 16th, 2025

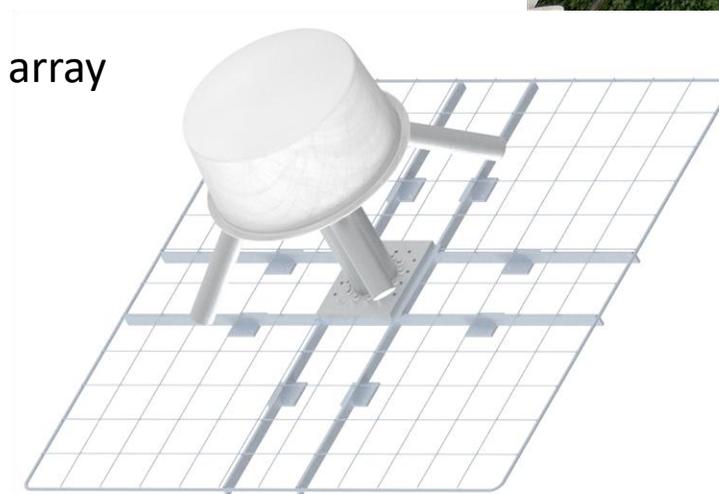

RF ALL THE TIME

- Dielectric is known for the RCA & Harris brands.
 - TV - Products
 - FM - Products
- 2017 Dielectric Gears up for TV Repack
 - Supplies over 1200 TV Antennas
 - Met our Demand Inquires FM
 - Met our Demand Inquires International
 - Met our Demand Inquires RF Custom
- Post TV Repack
 - TV still Strong
 - International and RF Custom growing
 - FM Not Growing and Slow
- Partner with SCMS 2024
 - FM Growing Fast

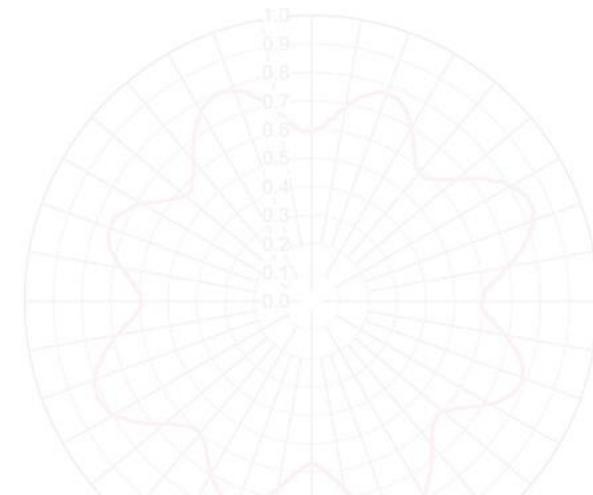

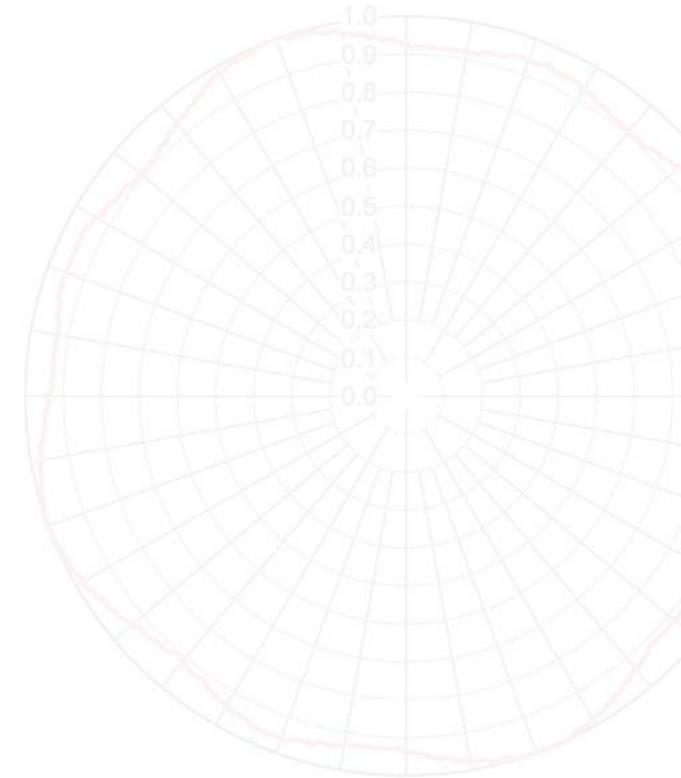

Overview

- New FM Technology:
 - DCPC
 - New panel design to increase reliability/reduce cost
 - Maintains/improves performance of traditional panels
 - RingMaster™
 - Maximizes DCR performance
 - Broad bandwidth and low RFR with less bays
 - Ring360
 - Top mounted omni FM antenna
 - Better performance/more reliable than a panel array

Trusted for Decades. Ready for Tomorrow.

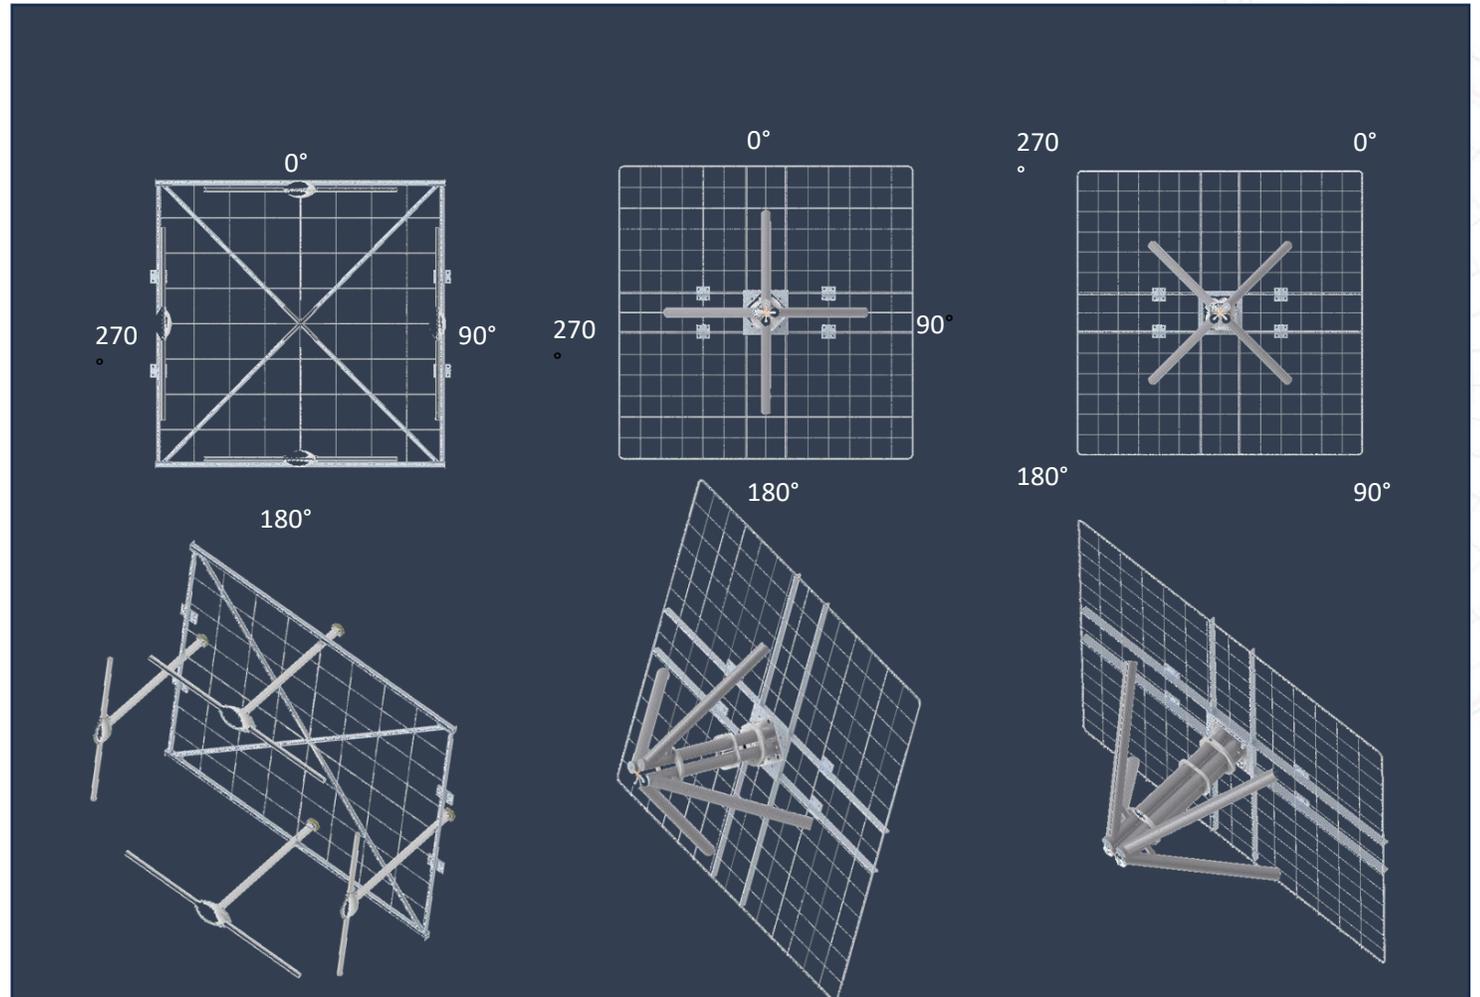

DCPC Panel

Conceptual Design

Historical Broadband Circularly Polarized FM Panel Antennas

- All designs available today:
 - Utilize rotating phase
 - Are variations of:
 - Quad dipole panel
 - Horizontal / Vertical dipole panel
 - +/- 45 Degree dipole panel
 - Have either 2 or 4 inputs
 - Single input requires a hybrid
 - Simplifies feed system but adds cost and complexity
 - Have 4 balun tubes

Quad Dipole Panel

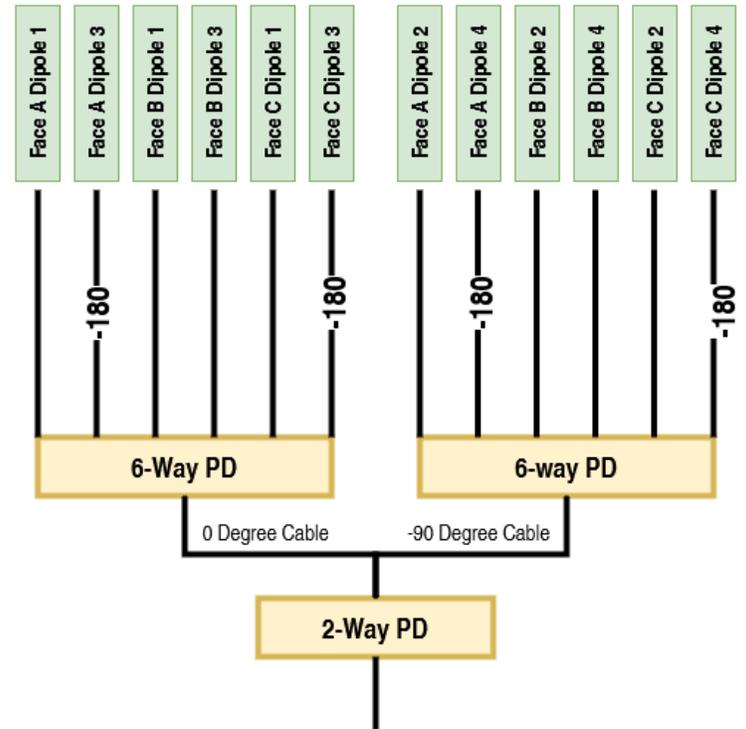

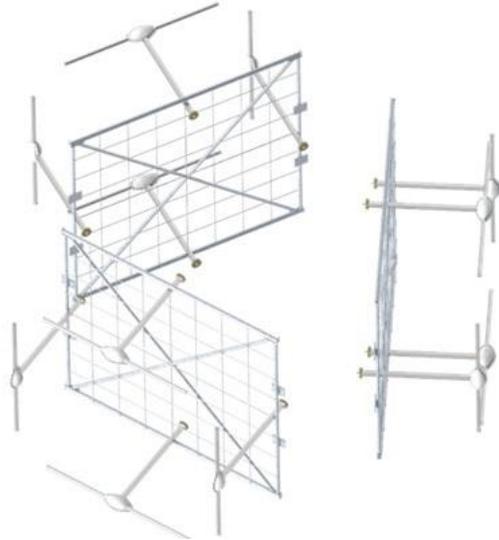

Horizontal / Vertical Dipole Panel

+/- 45 Degree Dipole Panel

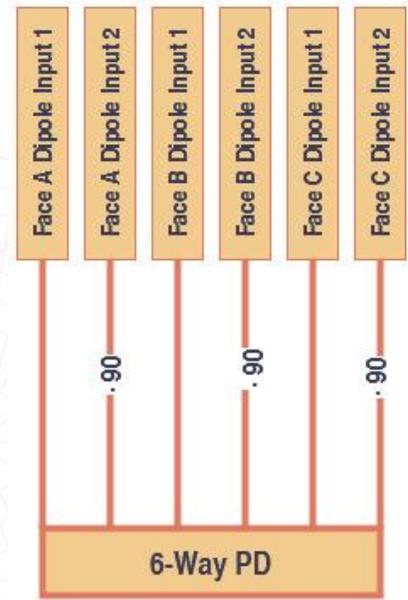

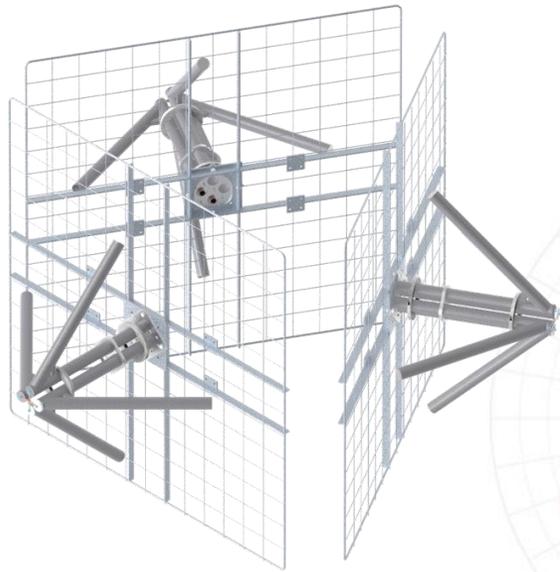

Conceptual Design

Feed System Comparison

Quad Dipole Panel

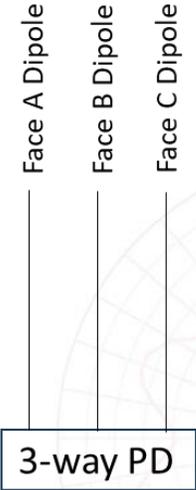

Horizontal / Vertical Dipole Panel
Or
+/- 45 Degree Dipole Panel

Trusted for Decades. Ready for Tomorrow.

Conceptual Design

What if we could design a broadband panel with a single input without the use of hybrids and only have one balun tube.....

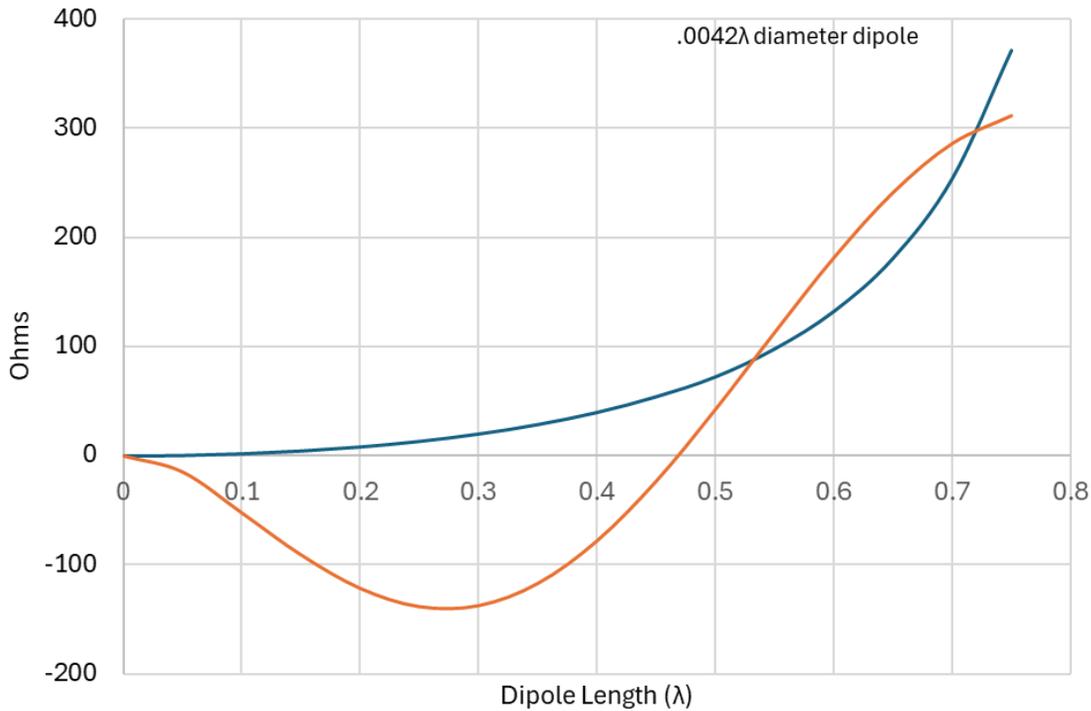

Conceptual Design

Impedance of a Dipole:

- real/imaginary parts are a function of both dipole length and radius

Dipole Input Impedance Vs Length

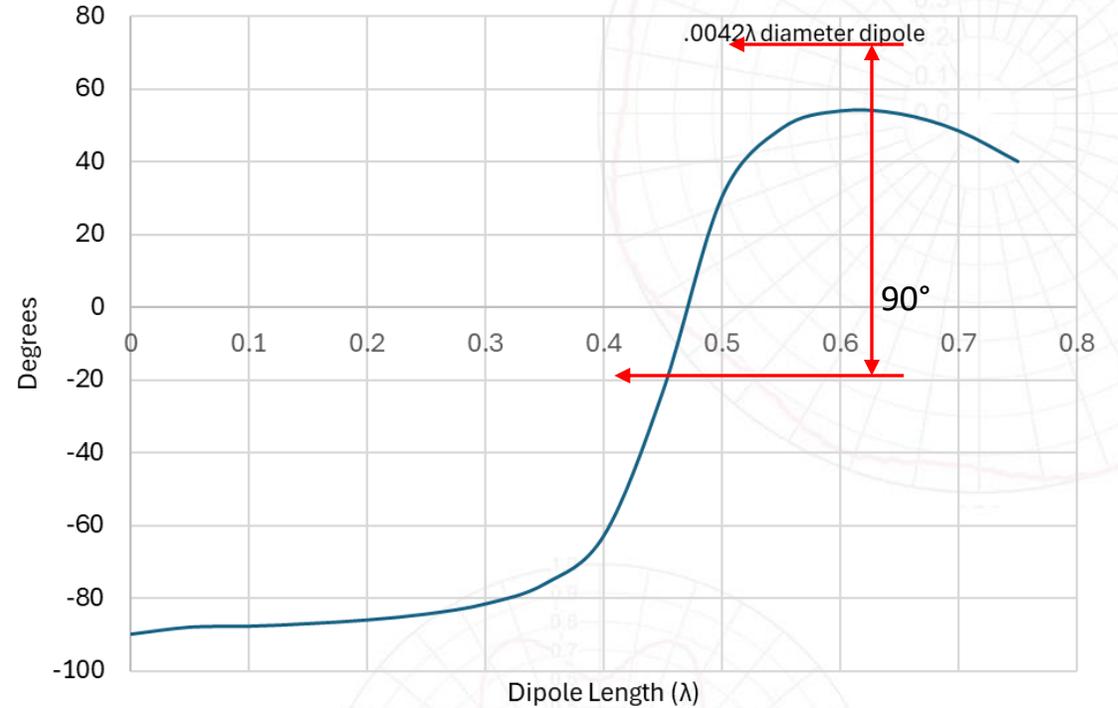

— Input Resistance Rin — Input Reactance Xin

$$\text{Phase} = \text{Tan}^{-1} \left(\frac{X_{in}}{R_{in}} \right)$$

Trusted for Decades. Ready for Tomorrow.

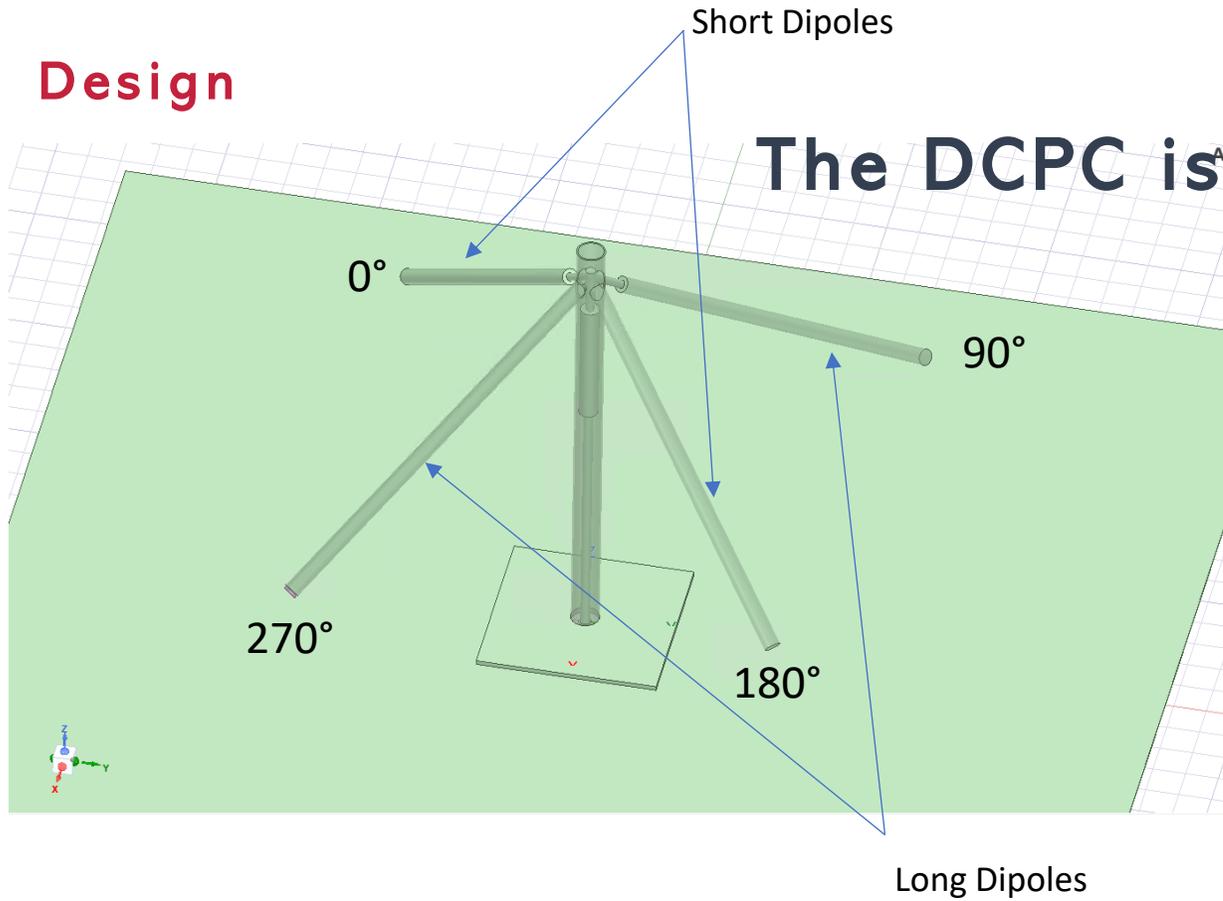

Dipole Feed Point Phase Vs Length

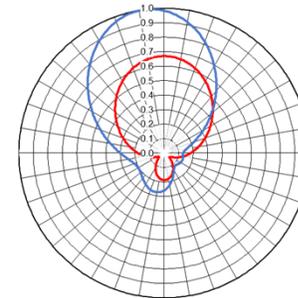

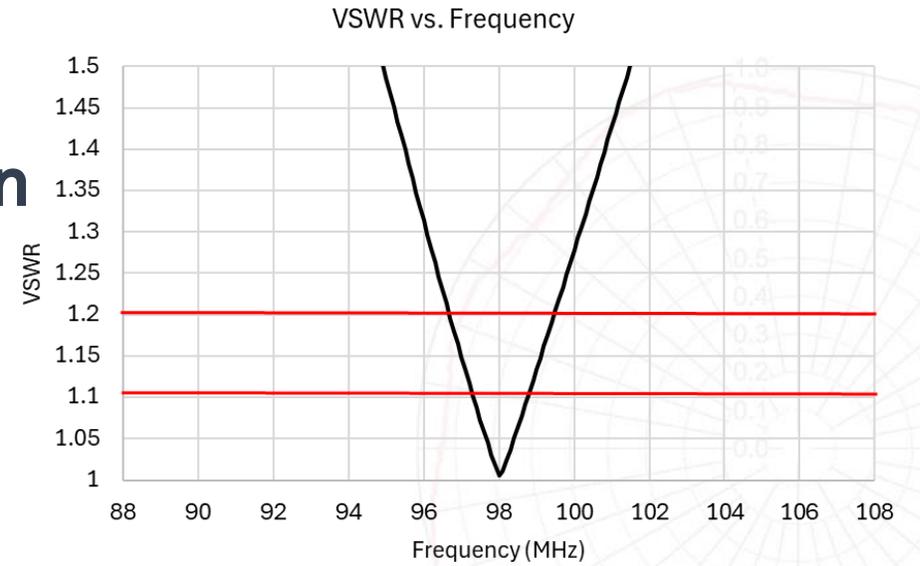

A Dipole with length $.52\lambda$ will radiate 90° ahead of a dipole of length $.43\lambda$

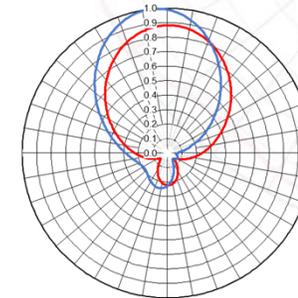

Design

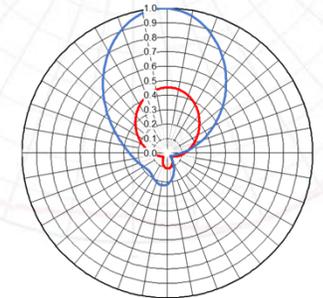

The DCPC is Born

88 MHz

98 MHz

108 MHz

Blue – Horizontal Polarization

Red – Vertical Polarization

Single input with single balun tube and phase rotation produces circular polarization

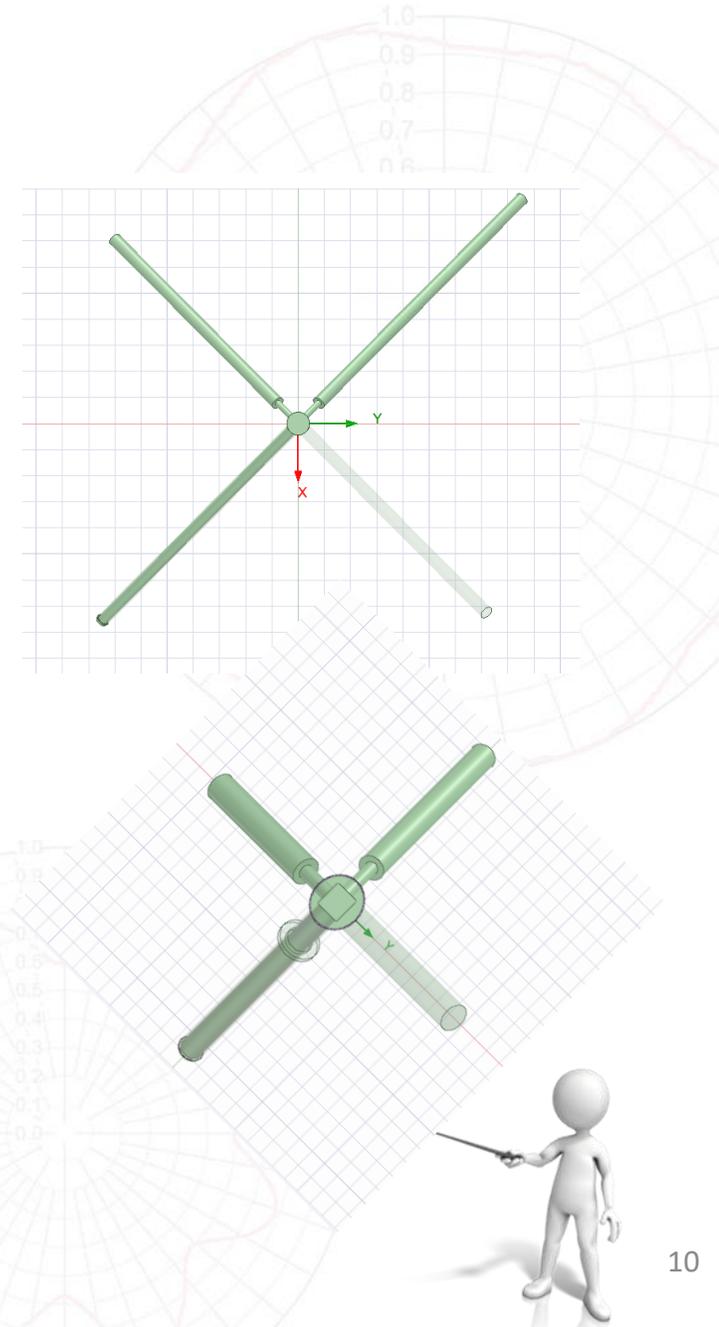

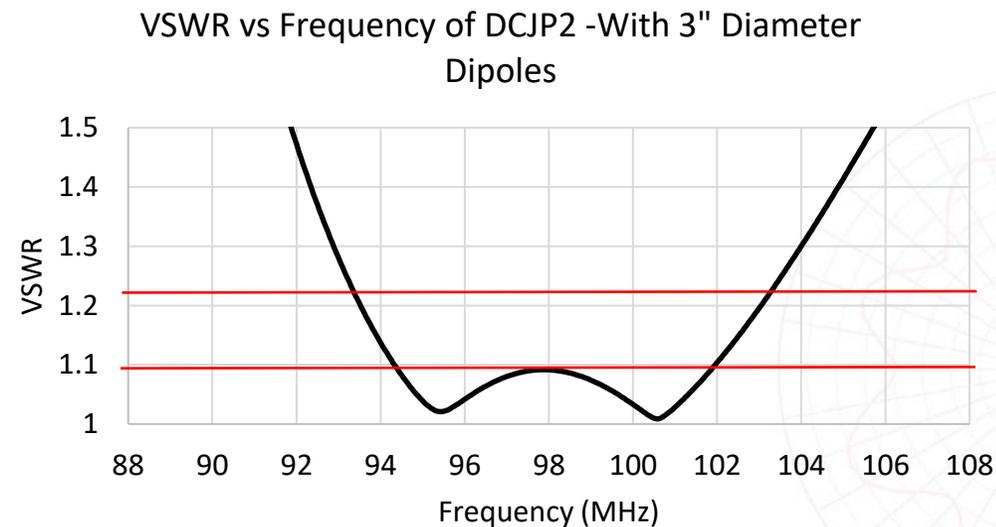

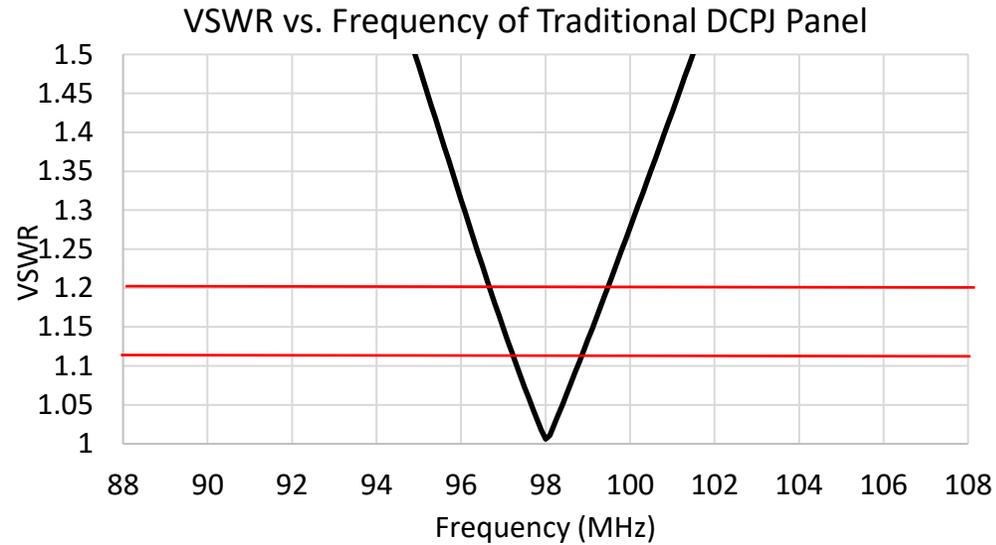

But....The bandwidth is only 3 MHz and H/V ratio varies across the band

Design

Increasing the Bandwidth – Dipole Diameter

Why Does a Larger Radius Increase Bandwidth?

- Thicker (larger-radius) dipole
→ Lower Q (quality) factor
 - $Q \propto 1 / \text{bandwidth}$
- Lower Q = Wider bandwidth

Design

Increasing the Bandwidth – Adding Short Circuit Stub

Using a Short-Circuit Stub for Impedance Matching

Concept Overview:

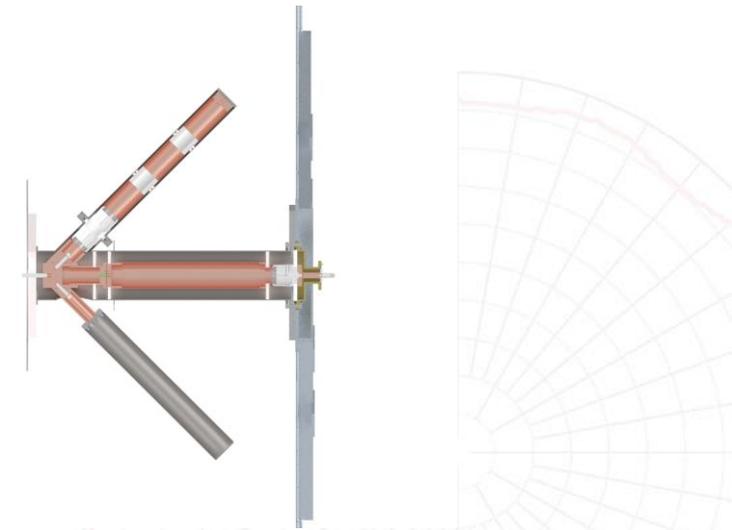

- A **short-circuit stub** placed on a transmission line acts as a **reactive element**.
- It can be sized and positioned to **cancel out the reactive component** of a load impedance.

Benefits:

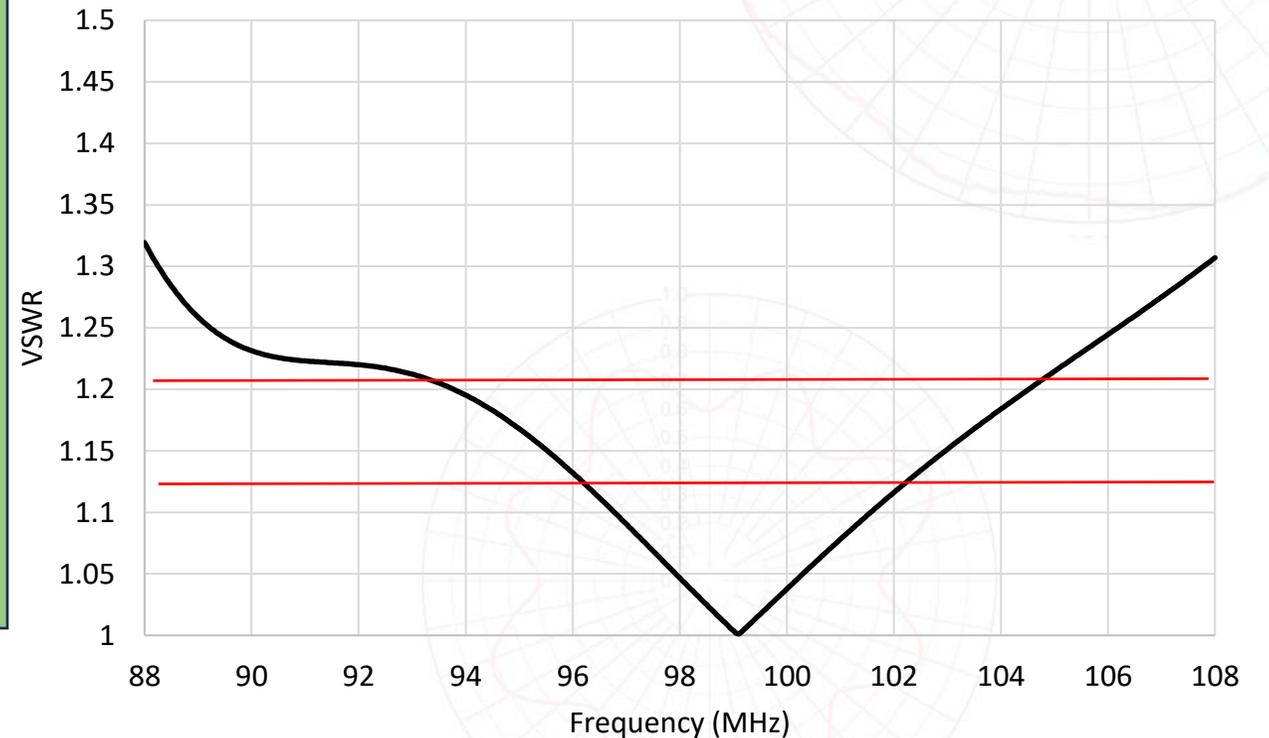

- Effectively **broadens the usable bandwidth (BW)**.
- Helps achieve a better impedance match over a wider frequency range.

Design Tip:

- **Place the stub as close to the load as possible** to maximize the bandwidth improvement.

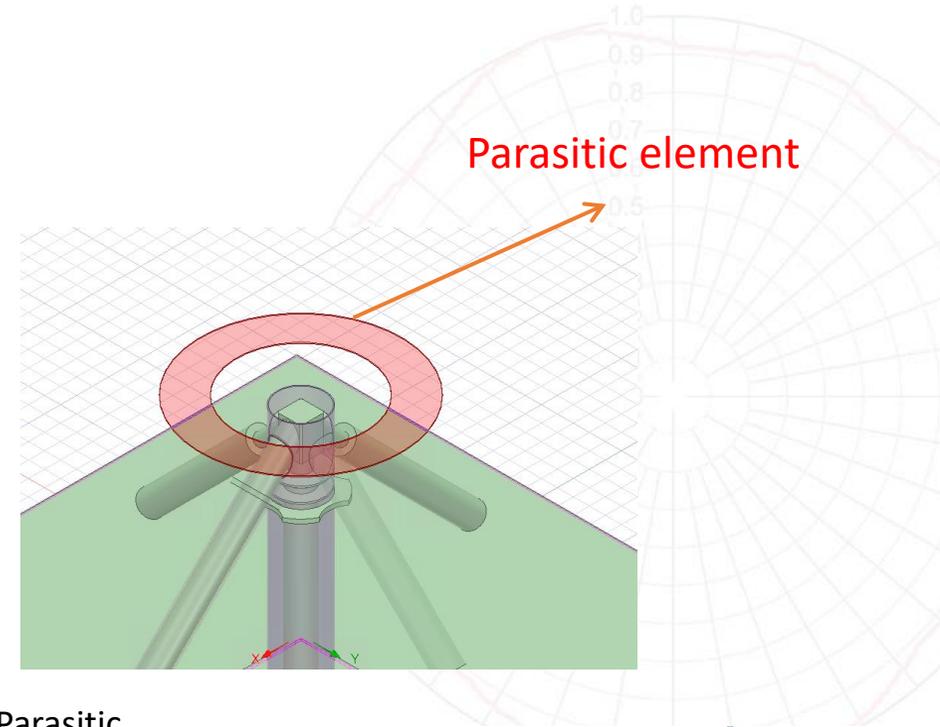

VSWR vs Frequency of DCPC -Addition of Short Circuit Stub

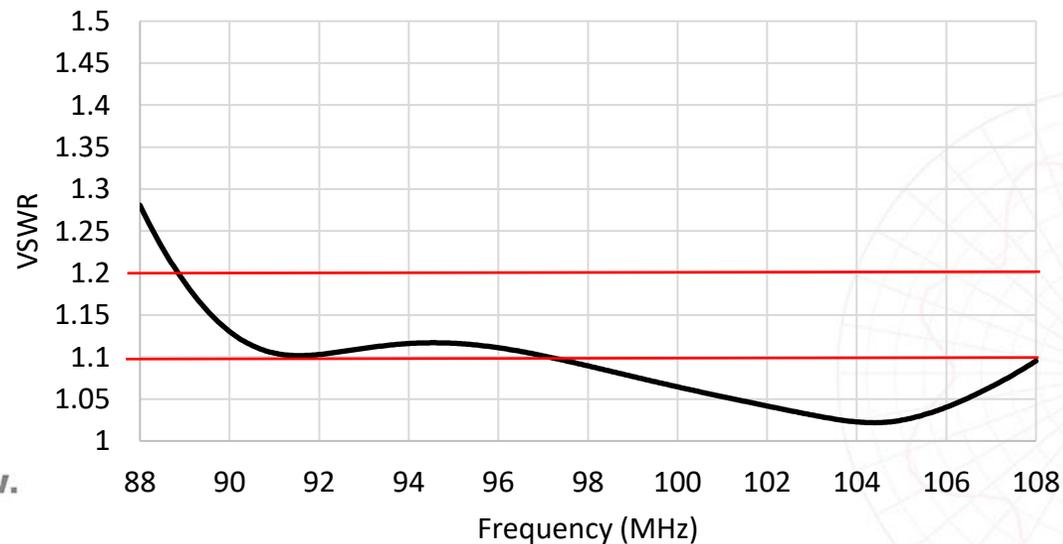

Design

Increasing the Bandwidth – Adding A Parasitic Element

- Parasitic element (e.g., rods, discs, rings) **not directly powered**.
- Electromagnetically **coupled to the driven antenna** (e.g., dipole).
- **Resonate at slightly different frequencies**, expanding the composite response.
- **Enhances bandwidth** by combining the response of driven and parasitic elements.
- **Common in wideband designs** like **log-periodic antennas** and **Yagi-Uda arrays**.

VSWR vs Frequency of DCPC -Addition Stub and Parasitic

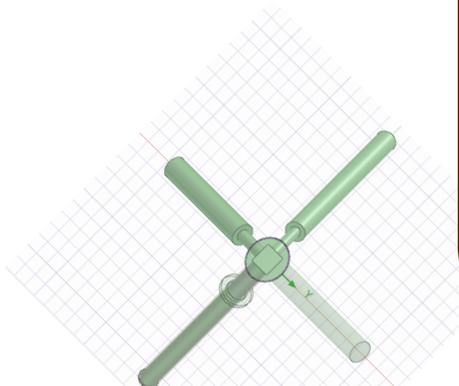

Design

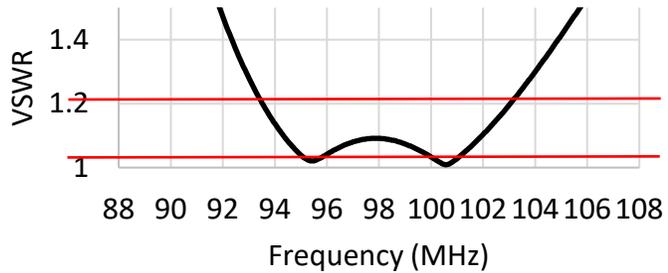

Dipole Diameter

Increase diameter from 1 inch to 3 inches

VSWR vs Frequency of DCPC -With 3" Diameter Dipoles

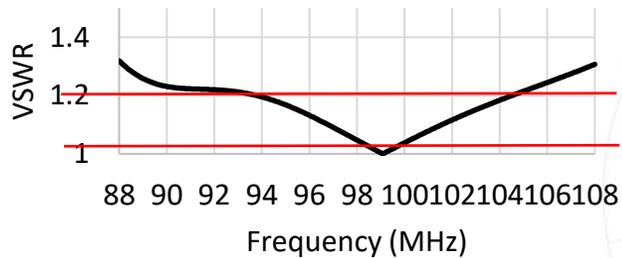

Short Stub

Helps achieve a better impedance match over a wider frequency range

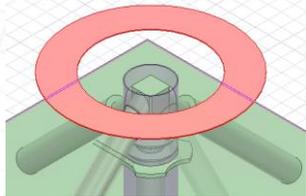

VSWR vs Frequency of DCPC - Addition of Short Circuit Stub

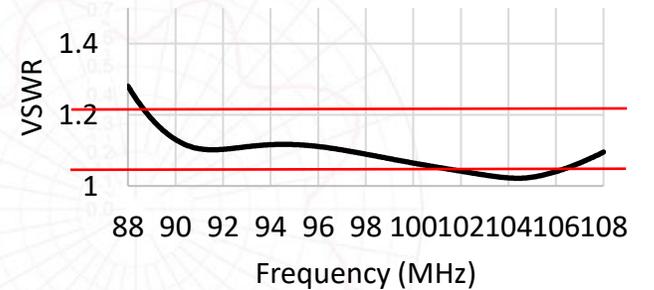

Passive Parasitic Element

Adding a passive Cone or a Disc Resonate at slightly different frequencies.

VSWR vs Frequency of DCPC - Addition Stub and Parasitic

Performance

H/V Polarization Ratio as a Function of Differential Dipole Length on DCPC

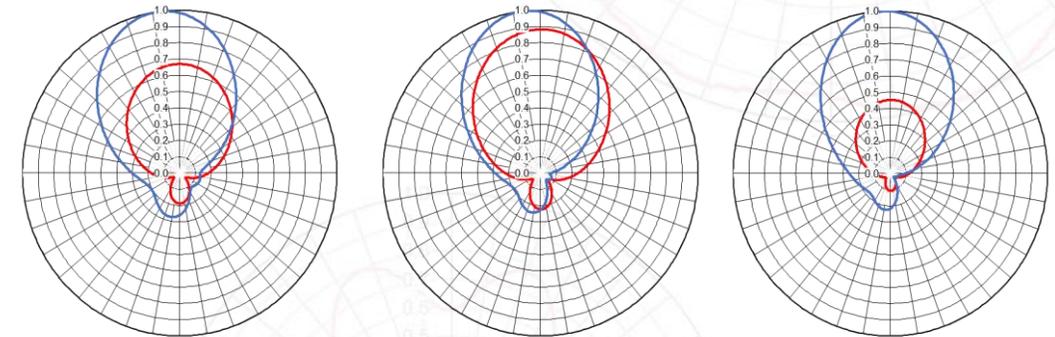

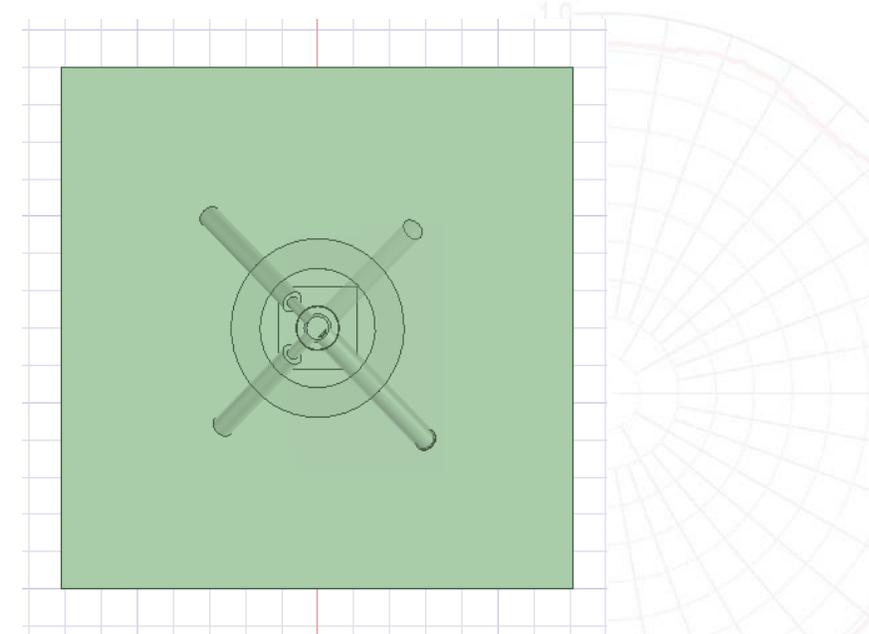

- The **Horizontal-to-Vertical (H/V) polarization ratio** is frequency-dependent due to variations in **differential dipole length** on the **DCPC** panel.
- At the **center frequency of 98 MHz**, the dipole geometry is designed so that: $H/V \text{ Ratio} \approx 1$

This achieves **equal horizontal and vertical components**, optimizing polarization balance.

- However, due to frequency sensitivity:
 - At **88 MHz**: $H/V \text{ Ratio} \approx 0.67$
 - At **108 MHz**: $H/V \text{ Ratio} \approx 0.45$

- The polarization ratio drops at the edges of the band because the dipole lengths become less effective at those frequencies.

Trusted for Decades. Ready for Tomorrow.

Performance

Fully Circular Stabilized Pattern in 6 Panel Configuration

DCPC panels circular pattern

CBR panels circular pattern

Performance

High-Power Handling in the DCPC Broadband FM Antenna

Traditional broadband FM master antennas must handle high combined power from multiple stations.

In conventional designs, the limiting factor is either:

- The **balun tube**
- The **flat feed strap** used to connect the balun's inner conductor to the dipole

These components are prone to electrical breakdown, especially under high power.

DCPC Design Improvements

- The new DCPC uses a **single, large 6-inch balun tube**

✓ No feed straps required

✓ Reduces breakdown risk significantly

- This is a **major improvement** over older designs that rely on **multiple small balun tubes and fragile feed straps**.

Power Applied (Single Bay):

10 kW

• **Measured Peak Voltage:**

4.11 kV/cm

• **Air Breakdown Threshold:**

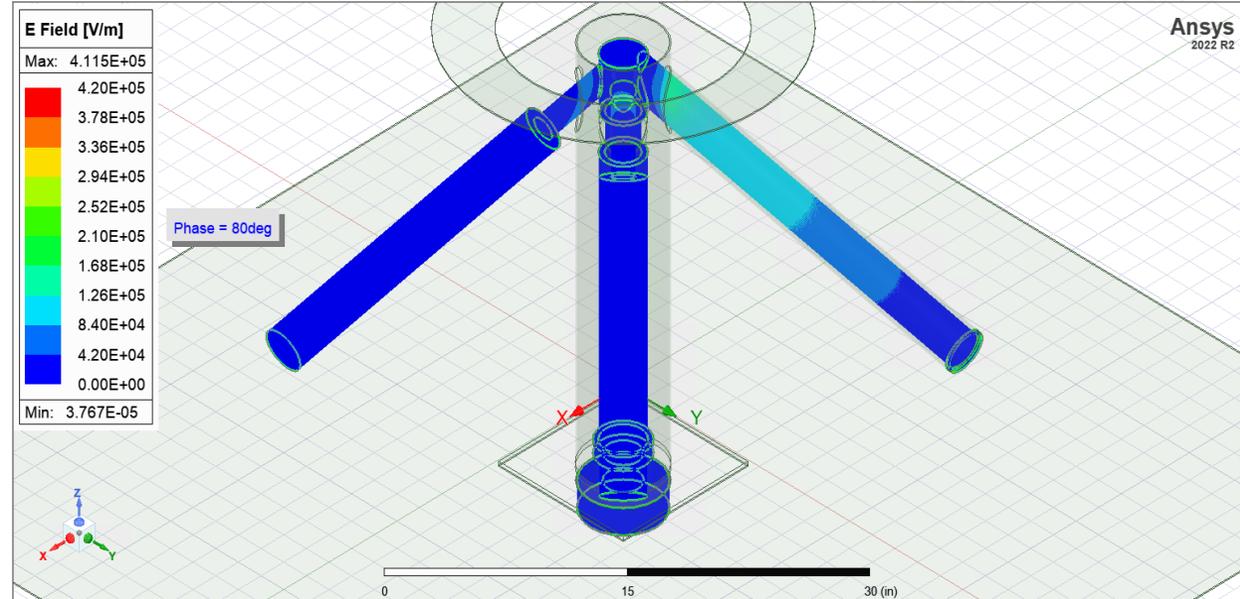

22.8 kV/cm

Voltage safety factor

$$\frac{22.8}{4.11} \approx 5.5:1$$

Peak power safety factor

> 30:1

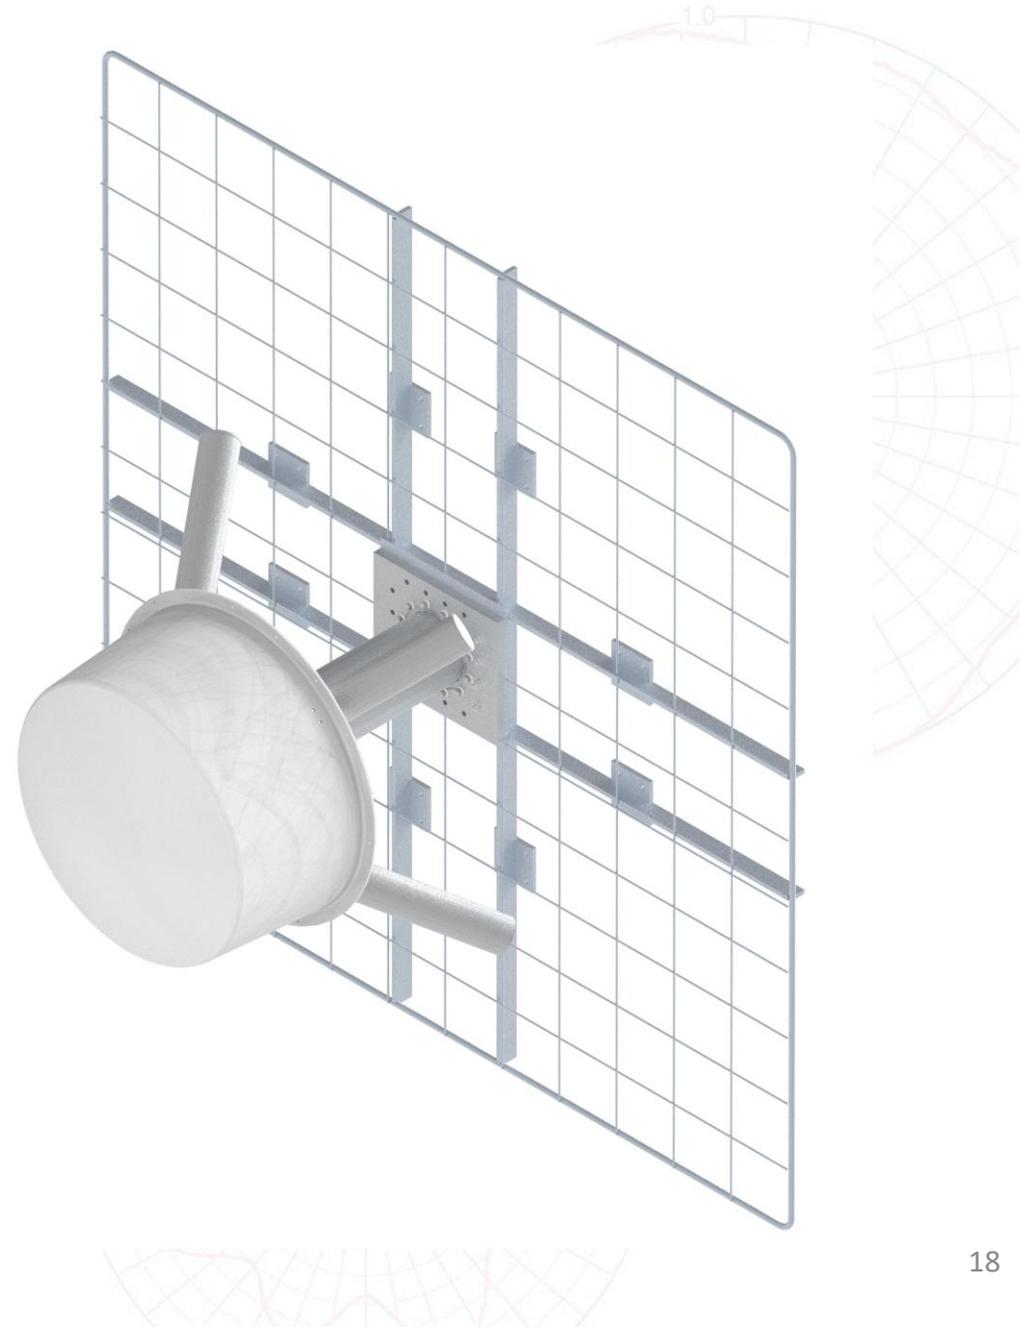

Conclusion

The new DCPC Panel:

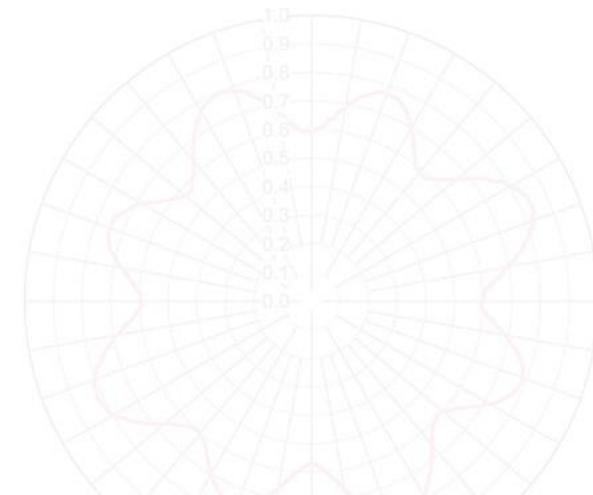

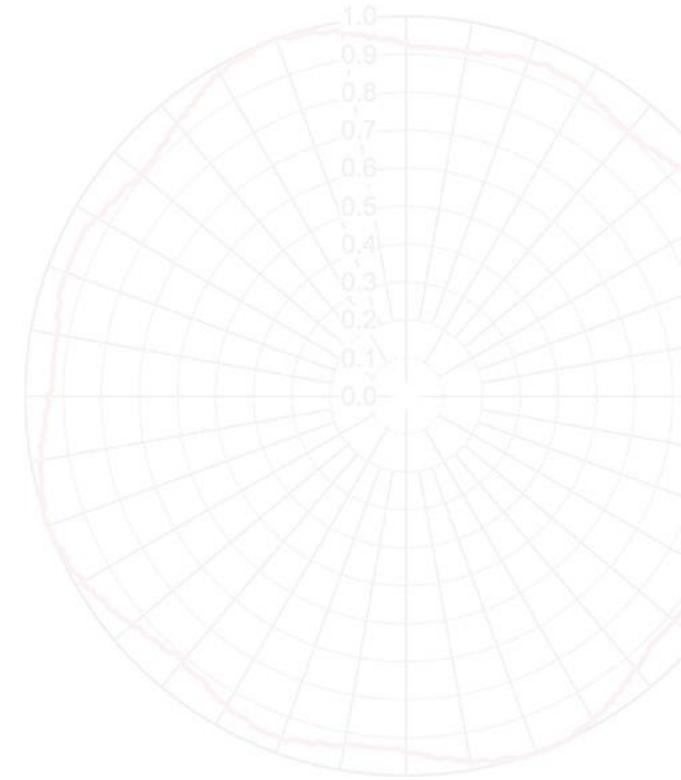

- Has increased reliability due to reduced complexity and number of components
ie: Power Dividers, Feed lines, Balun tubes
- Eliminates power vulnerable components
ie: Hybrids, Feed straps

All this means reduced cost!!

Trusted for Decades. Ready for Tomorrow.

RingMaster™

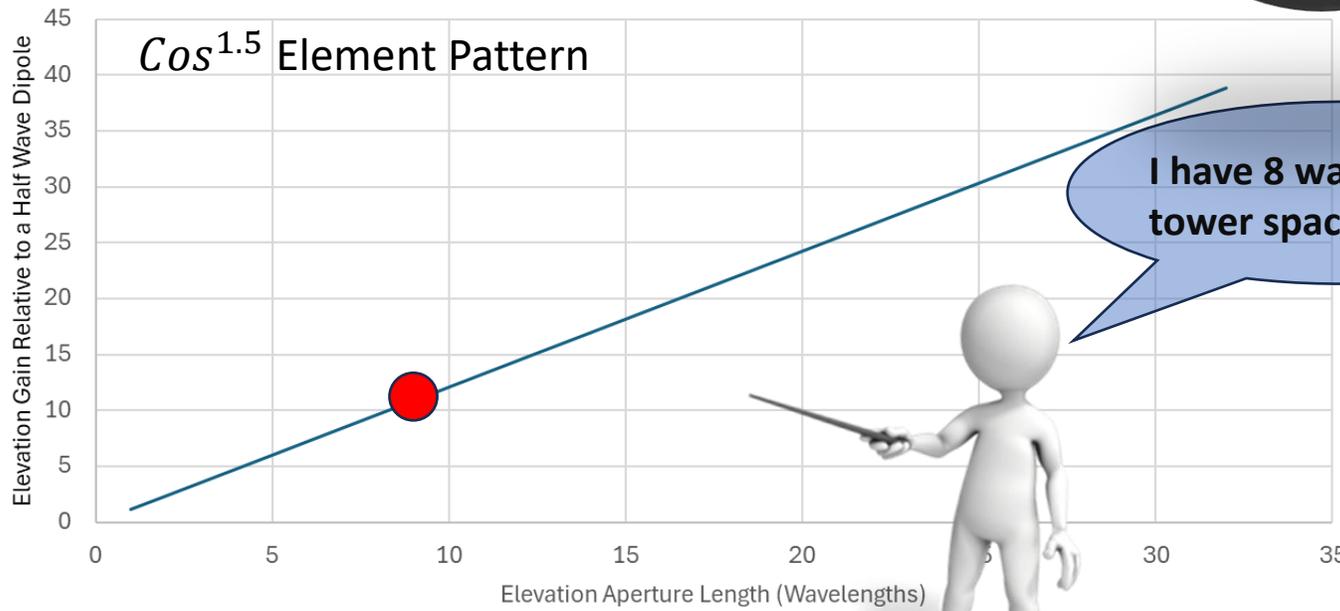

Historical Side Mount FM Antenna Configurations

- FM antenna configurations:

- Full-wave
- Half-wave
- $(N-1)/N$ ($\frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \frac{5}{6}, \frac{6}{7}, \frac{7}{8}, \dots$ wave)

Maximum Elevation Gain vs. Elevation Aperture Length

I have 8 wavelengths of tower space available

Max Gain Options

- 8 (1λ) spaced bays (Narrow Band Applications)
- 16 ($\frac{1}{2}\lambda$) spaced bays (Broadband Applications)
- 9 ($\frac{7}{8}\lambda$) spaced bays (Low RFR Applications)

Trusted for Decades. Ready for Tomorrow.

Full-Wave Spacing - Bandwidth

Simplest of all the options

- IEEE -2015 “Considerations for -10 dBc IBOC Combined Station Side-mount Master FM Antenna Design”
 - Maximum achievable bandwidth of a circularly polarized FM ring antenna radiator is given by:

John Schadler, 2015

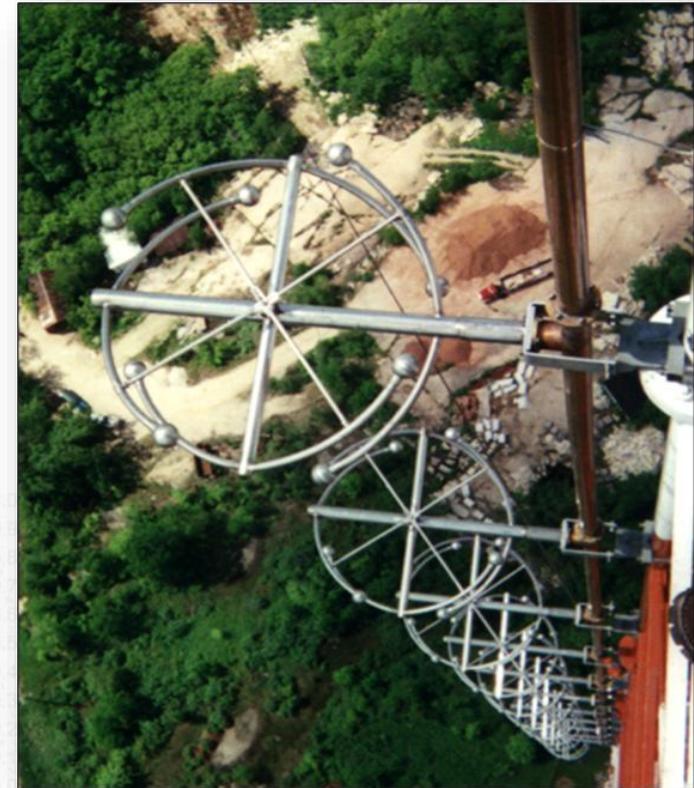

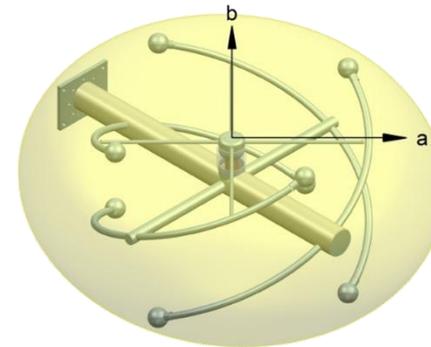

$$bw = 3.9 \cdot \left[\frac{VSWR - 1}{\frac{a}{2b} \left(\frac{1}{k^3 a^3} + \frac{2}{ka} \right) \sqrt{VSWR}} \right]$$

Where : a and b are the major and minor ellipse radii
VSWR is the maximum allowed within the passband

BW is Purely a function of Volume

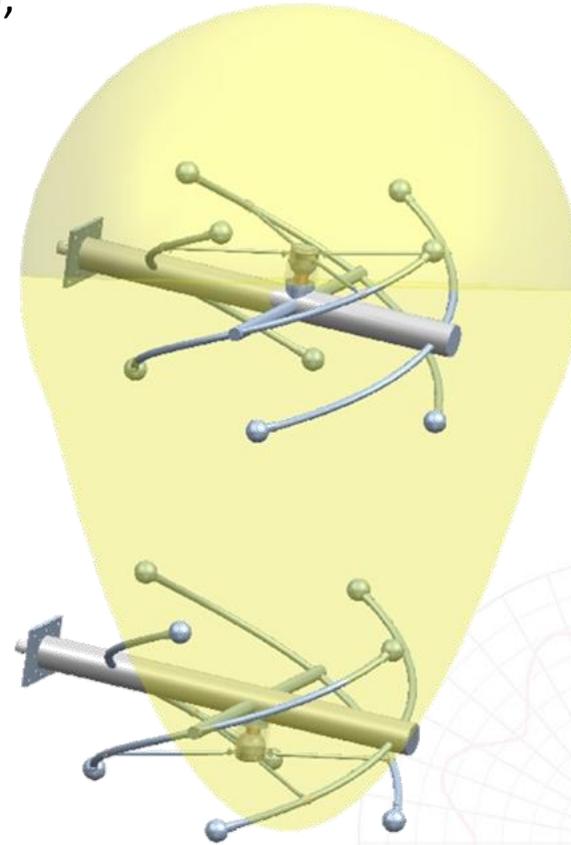

So....Is making the bay bigger the only way to increase the bandwidth?

Half-Wave Spacing - Bandwidth

What happens in a $\frac{1}{2}$ wave spaced configuration?

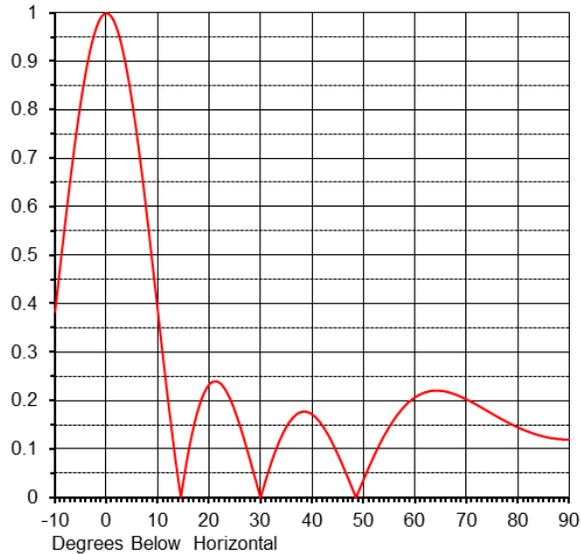

- When bays are brought close together ($\frac{1}{2}$ wave spaced), there is heavy mutual coupling.
- Coupling “stretches” the volume
 - Increases the apparent volume and thus the achievable bandwidth

N-1/N and Downward Radiation

- The null locations in an elevation pattern are defined by:

$$\delta = \sin^{-1} \left(\frac{k\lambda}{nd} \right) \quad \text{Where: } \begin{array}{l} \delta = \text{Null angle} \\ n = \text{Number of layers} \\ d = \text{Layer spacing} \\ k = \text{Integer} \\ k \neq n \end{array}$$

Example : n=4
d=1
Gain = 4.6

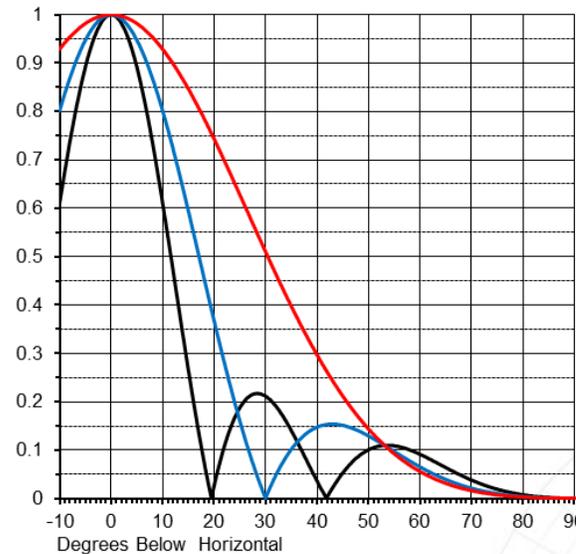

k	Null angle
1	14.5
2	30.0
3	48.6

Trusted for Decades. Ready for Tomorrow.

- A null at 90 degrees will eliminate downward radiation

$$90 = \sin^{-1} \left(\frac{k\lambda}{nd} \right) \quad \text{or} \quad \left(\frac{k\lambda}{nd} \right) = 1 \quad \rightarrow \quad d = \frac{k\lambda}{n} \quad \text{for } k = 1, 2, 3 \dots$$

Example: For n=4, k=1,2,3 The solutions are $d = \frac{\lambda}{4}, \frac{2\lambda}{4}, \frac{3\lambda}{4}$

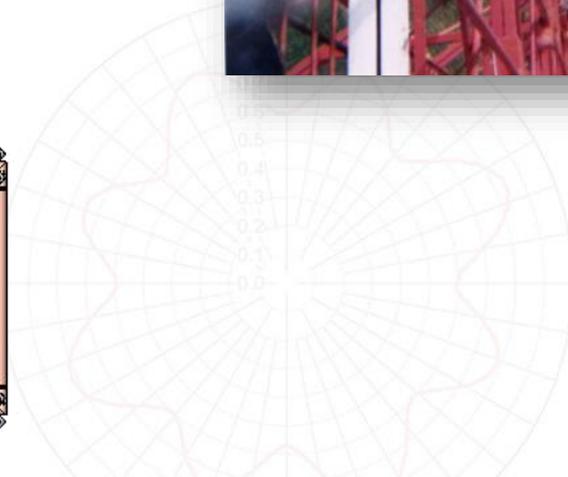

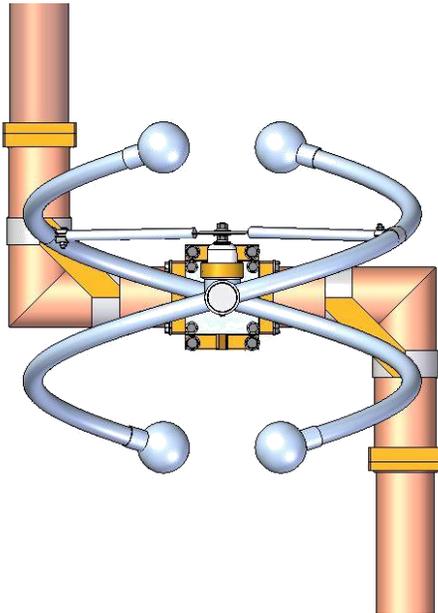

d=.25 Gain = 1.6
d=.5 Gain = 2.7
d=.75 Gain = 3.8

Note $k = 3$ or $\frac{(n-1)\lambda}{n}$ provides the most gain
efficient solution for zero downward radiation

N-1/N Spacing

- N-1/N spacing is achieved by “The Funky Elbow”
- Zigzag the feedline to keep the bays in phase but shorten the distance between them
- 2 Extra elbows per bay

Historical FM Side Mount Antenna Configurations – Pro's and Con's

For the same aperture space and gain:

	Full-wave spaced	Half-wave spaced	(N-1/N) spaced
Pro's	<ul style="list-style-type: none">• Min # of elements• Lowest Wind load	<ul style="list-style-type: none">• BW increased (full band achievable)• Reduced sensitivity• No downward radiation• Higher power / voltage handling	<ul style="list-style-type: none">• No downward radiation
Con's	<ul style="list-style-type: none">• Limited BW• Downward radiation	<ul style="list-style-type: none">• Max # of elements• Cost• Highest wind load	<ul style="list-style-type: none">• Limited BW• Cost: elbows• More connections

A New Option

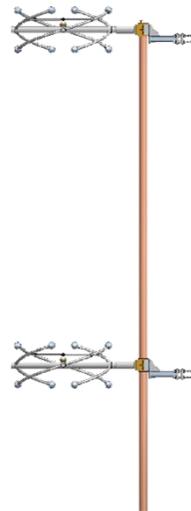

- **RingMaster™**
 - Combinations of half and full wave spaced bays
 - Reduces number of bays in the same aperture
 - Maintains broadband characteristics
 - Simple concept
 - New technique incorporating known technology

RingMaster™

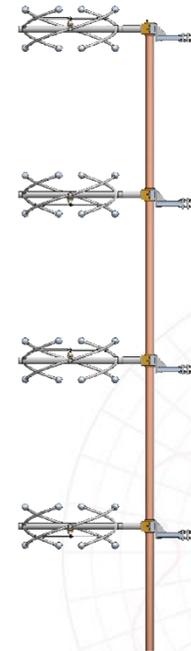

Maximizing DCR
Antenna Performance

Patent Pending

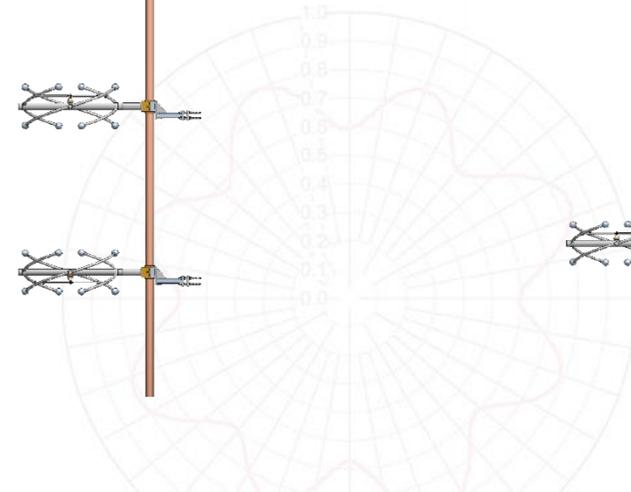

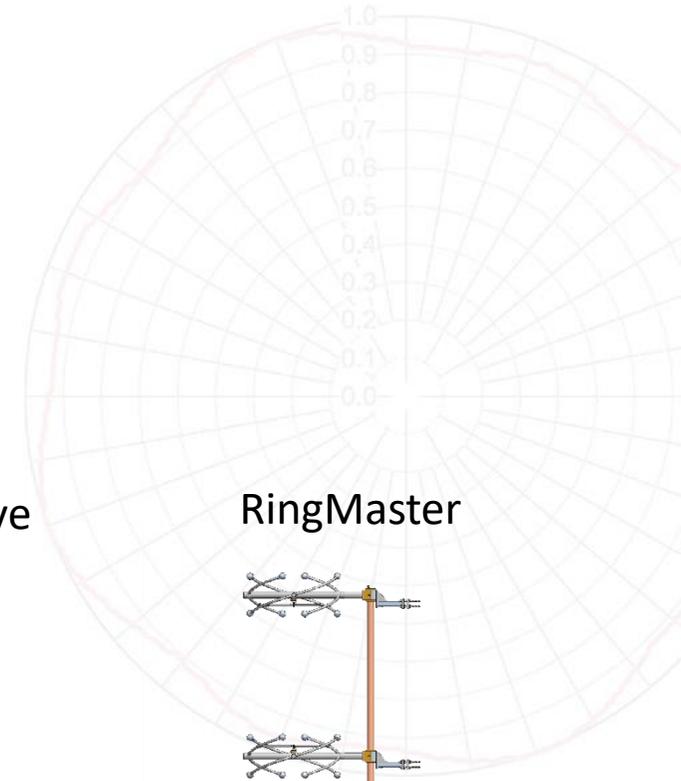

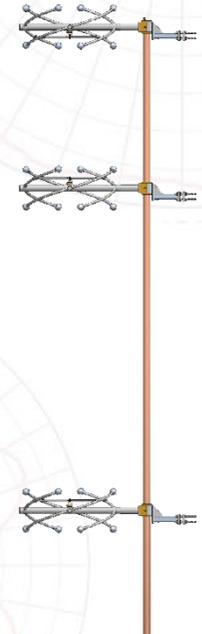

Traditional Full Wave

Traditional Half Wave

RingMaster

Variety of Options and Combinations

- Not limited to any particular bay type (Q, M, S, C, H.....bay)
- Flexibility in combinations

DCRM-6 Center fed $\left[\frac{1}{2}, 1, 1, 1, \frac{1}{2}\right]$

DCRC-6 End Fed $\left[1, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}\right]$

DCRU-8 Dual Center fed $\left[\frac{1}{2}, 1, \frac{1}{2}, 1, \frac{1}{2}, 1, \frac{1}{2}\right]$

Note : $\frac{1}{2}$ wave pairs will provide low RFR

For 3 to 12 Bays:
Possible full wave / half wave combinations for each bay type

Bays	Spacing Combinations
3	2
4	6
5	14
6	30
7	62
8	126
9	254
10	510
11	1022
12	2046
16	32766

Providing the Best Bandwidth with the Least Number of Elements

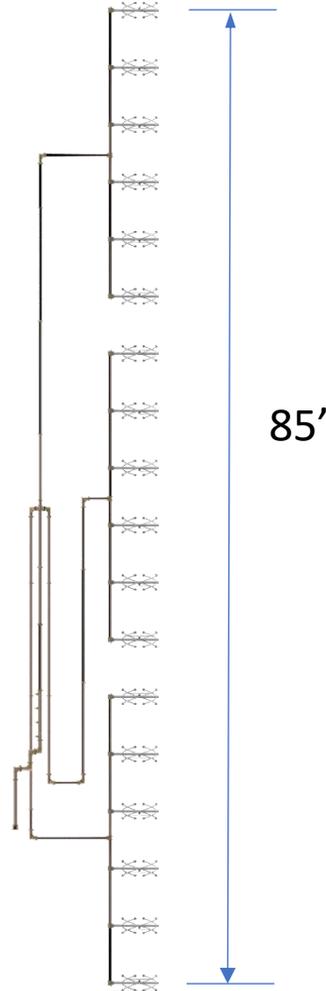

Example

- Available aperture space of 90'
- Side mount
- Broadband - Multi frequency
- Options
 - 18 Bay - Half wave spaced
 - 12 Bay - RingMaster
 - 12 Bay - RingMaster low RFR
- If Low RFR is a requirement, the two choices are either the 18 bay $\frac{1}{2}$ wave spaced or the RingMaster Low RFR

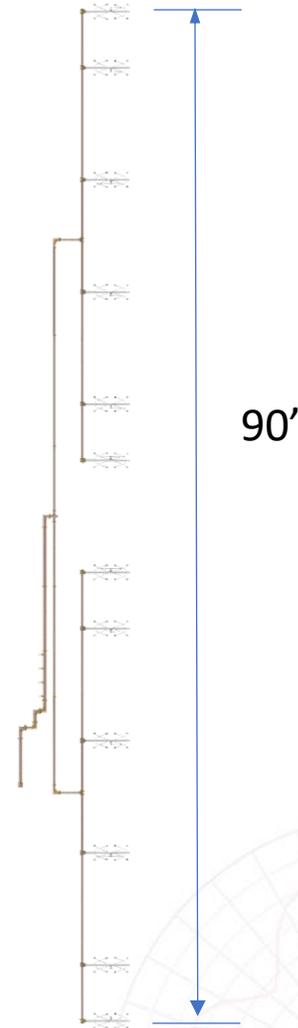

Bottom Line: The RingMaster designs require 33% less radiators

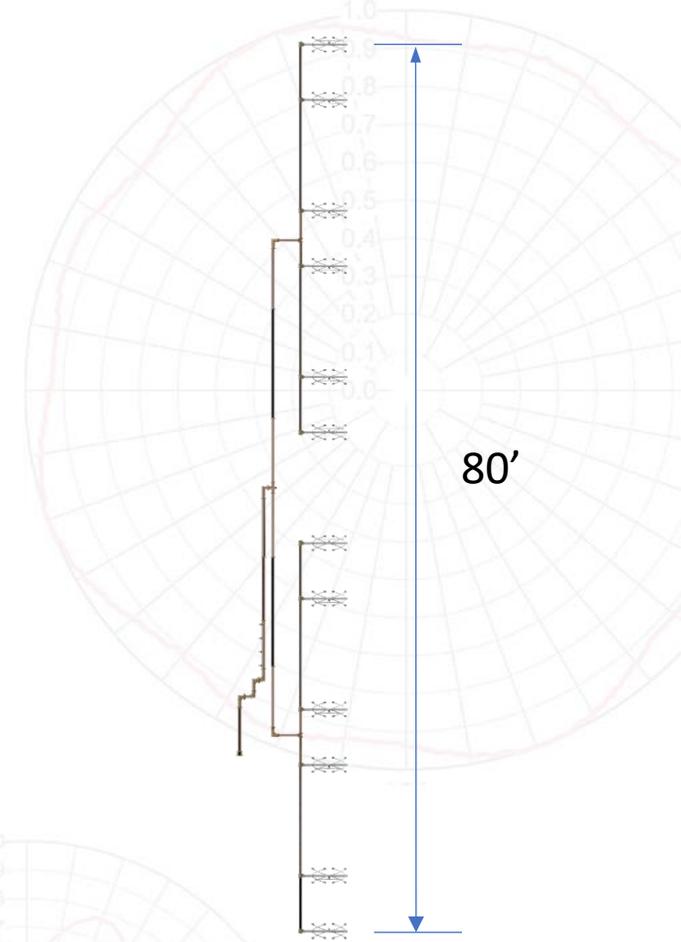

18 Bay $\frac{1}{2}$ wave spaced

12 Bay – RingMaster

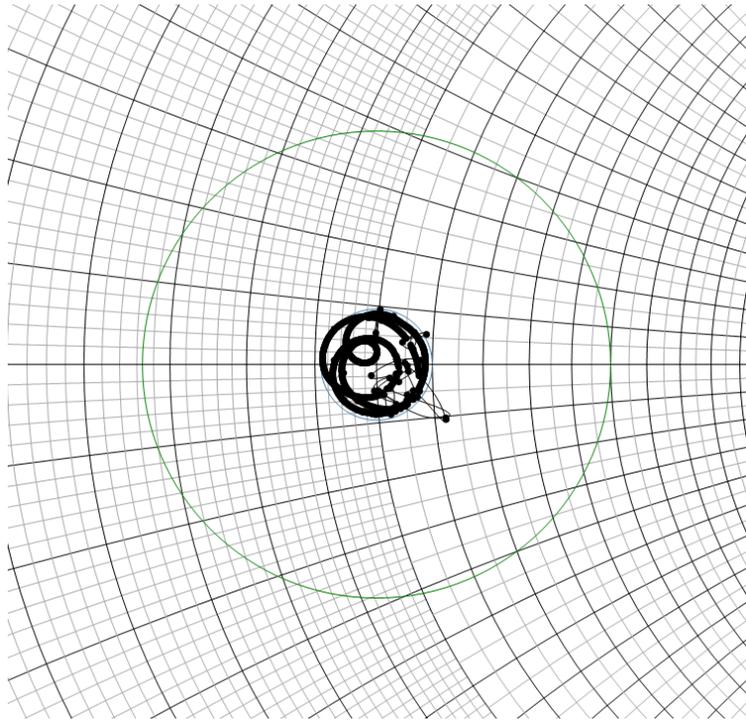

12 Bay – RingMaster Low RFR

Installed Example

- DCRU16DC(SP)RF10
 - 16 bay – Low RFR
 - 13 channels of operation between 90.9 and 106.7 MHz
 - Channels under 1.1:1 VSWR, Band under 1.1:1 VSWR
 - Same gain as a 24 Bay ½ wave spaced
 - **33% Less Radiators!**

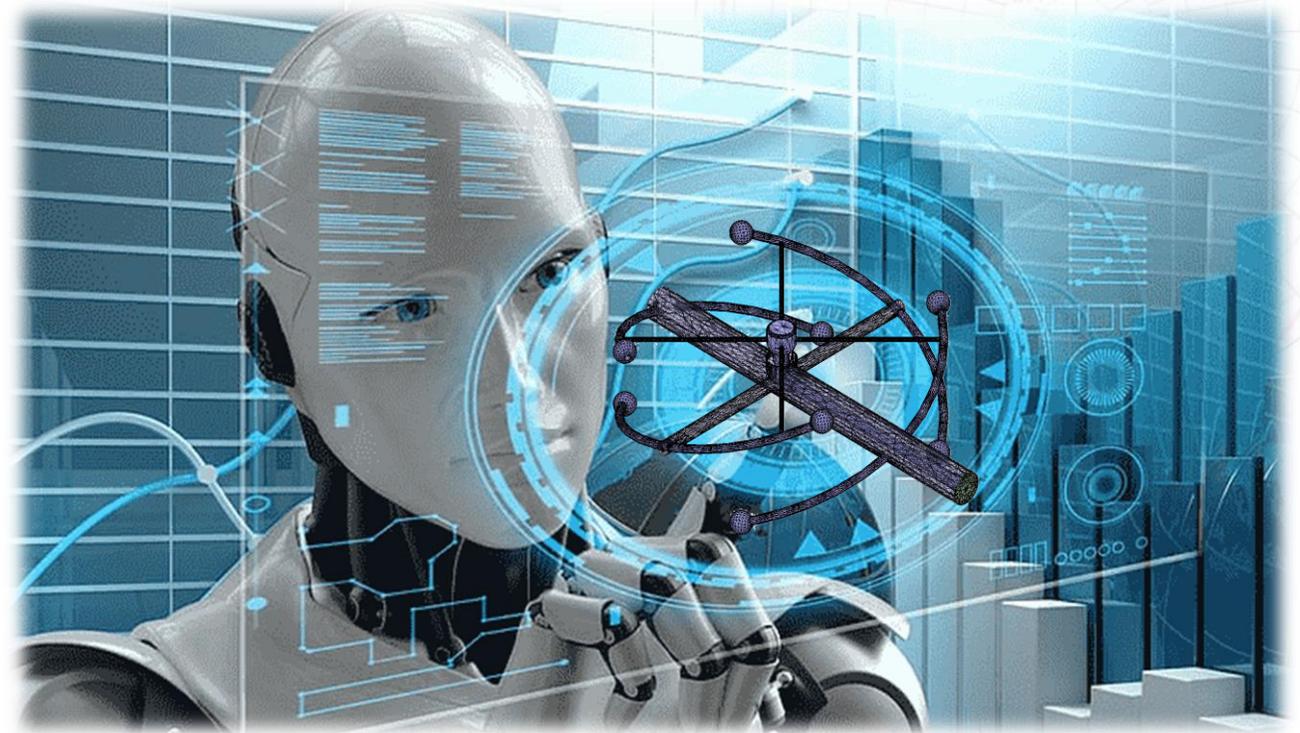

Trusted for Decades. Ready for Tomorrow.

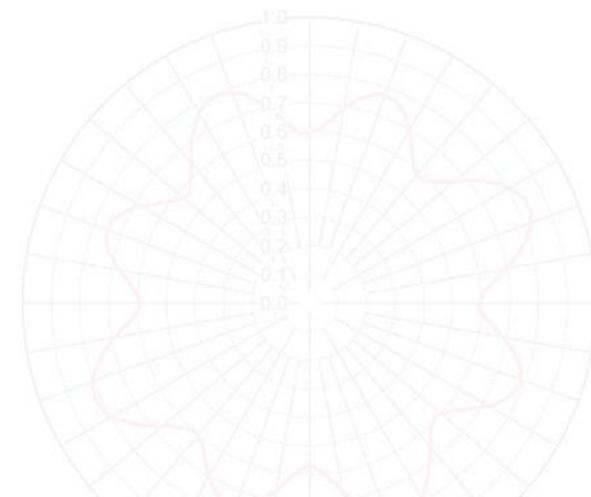

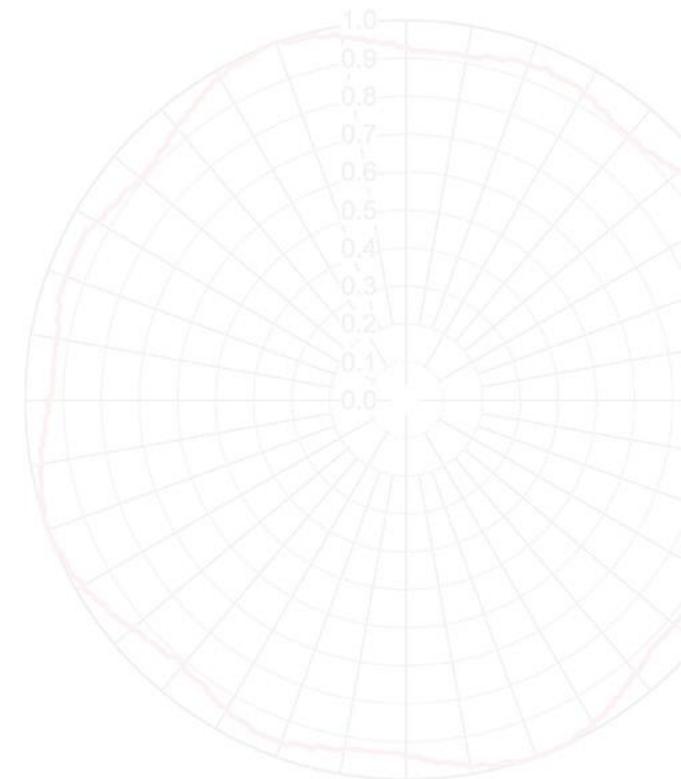

RingMaster™ Conclusions

- The RingMaster maximizes DCR performance
 - Technique providing broad bandwidth and low RFR with less bays
 - Less connections
 - Less wind load
 - Less weight
 - Lower cost

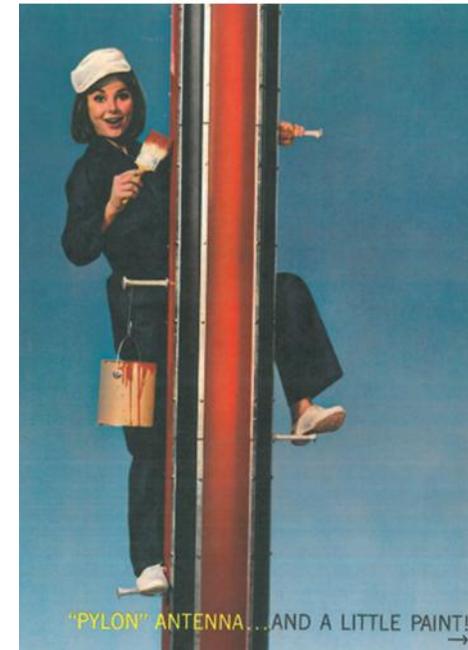

Ring360

PYLON ANTENNAS

- Term coined by RCA
- Top mounted slotted coaxial antenna
- Long, thin, round structures
- Smaller in size and less wind load than other broadcast antennas
- Fewer parts/connections
 - Simplicity = Reliability!
- One disadvantage: inherently narrow bandwidth
$$\%bw = \frac{f_h - f_l}{f_0} \times 100$$
- Natural bandwidth: 1-2% at UHF

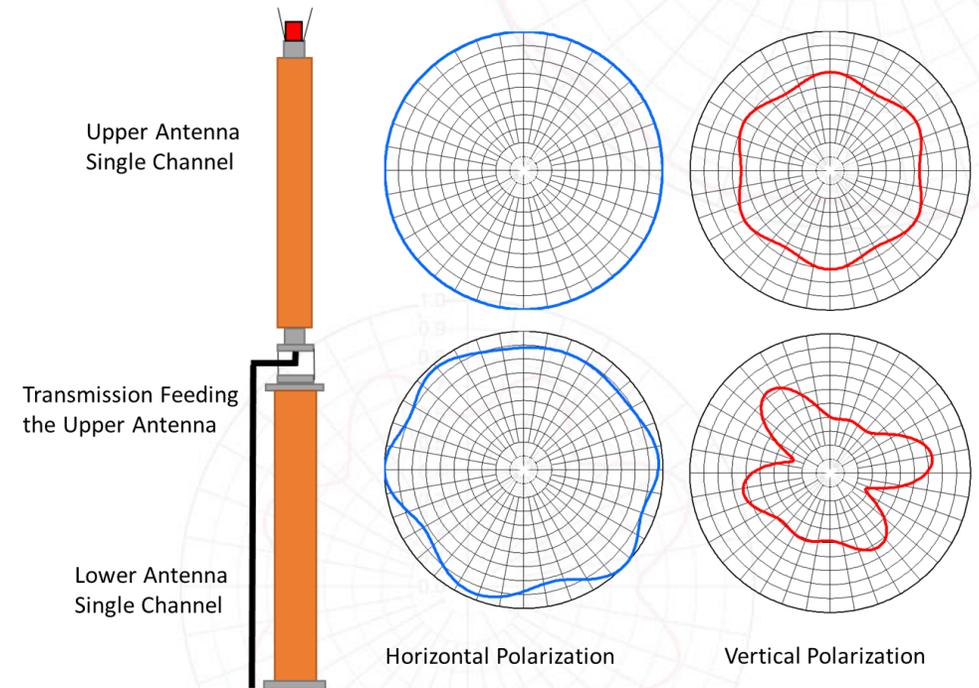

Just a "little bit of paint"
is enough to maintain ...

STACKED PYLON ANTENNAS

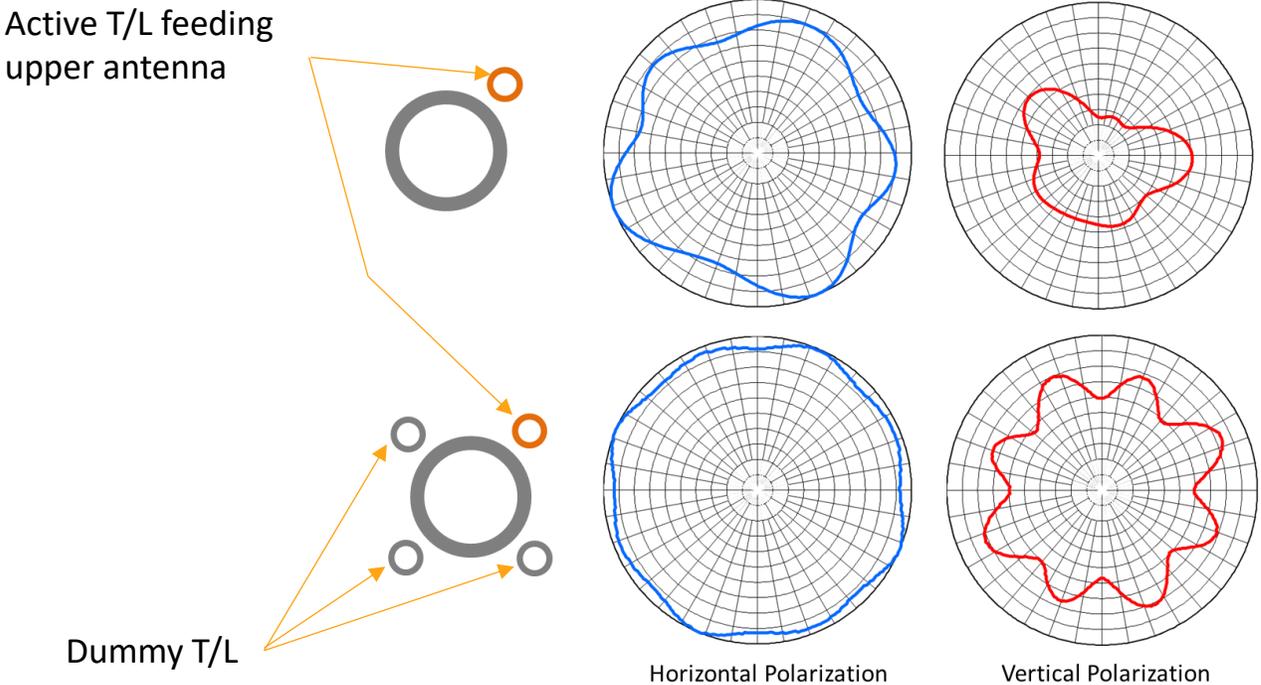

- Historically top mounted multi-channel pylons are single channel antennas structurally stacked
- Each are center fed by a harness
 - Mechanically end fed but electrically center fed

- Disadvantages:
 - Twice the height of single antenna
 - TL feeding top antenna affects the pattern of the lower antenna

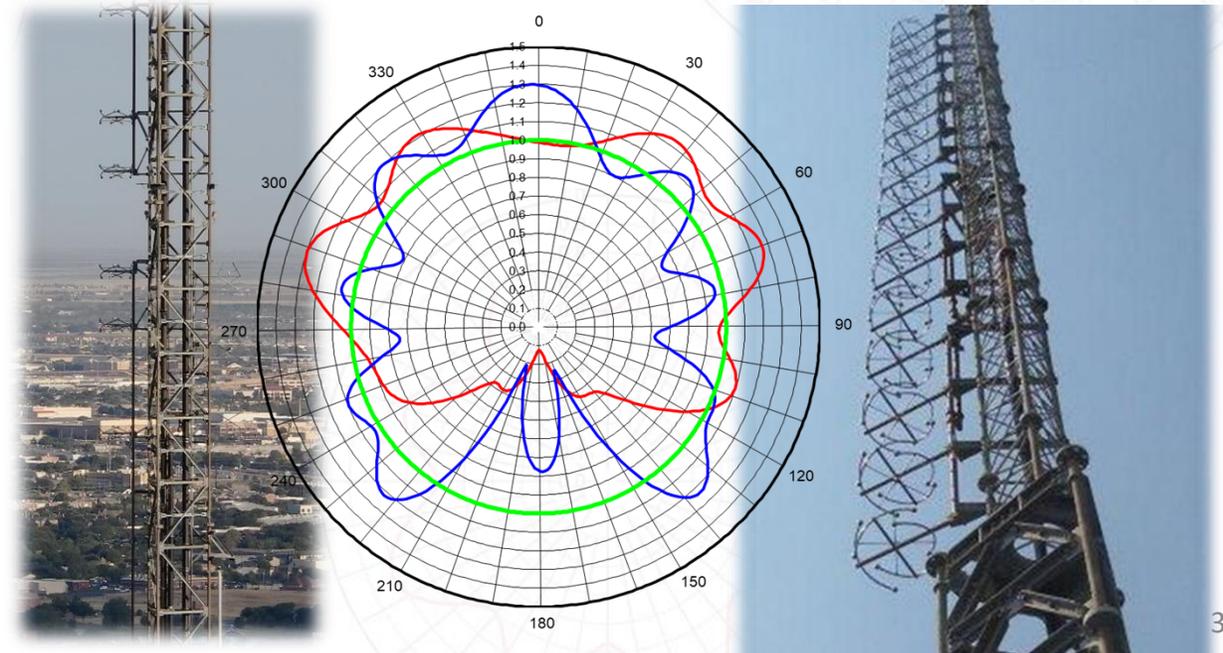

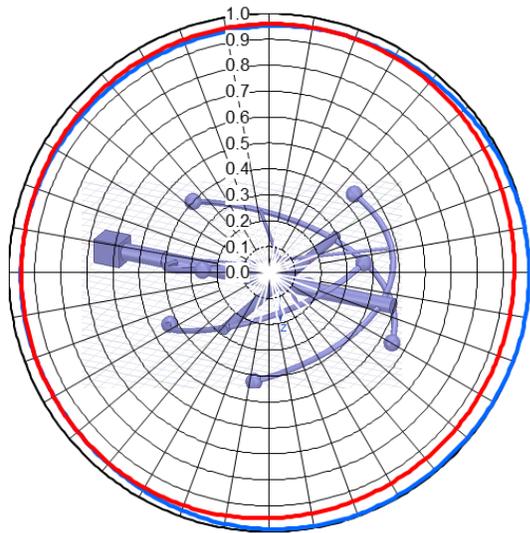

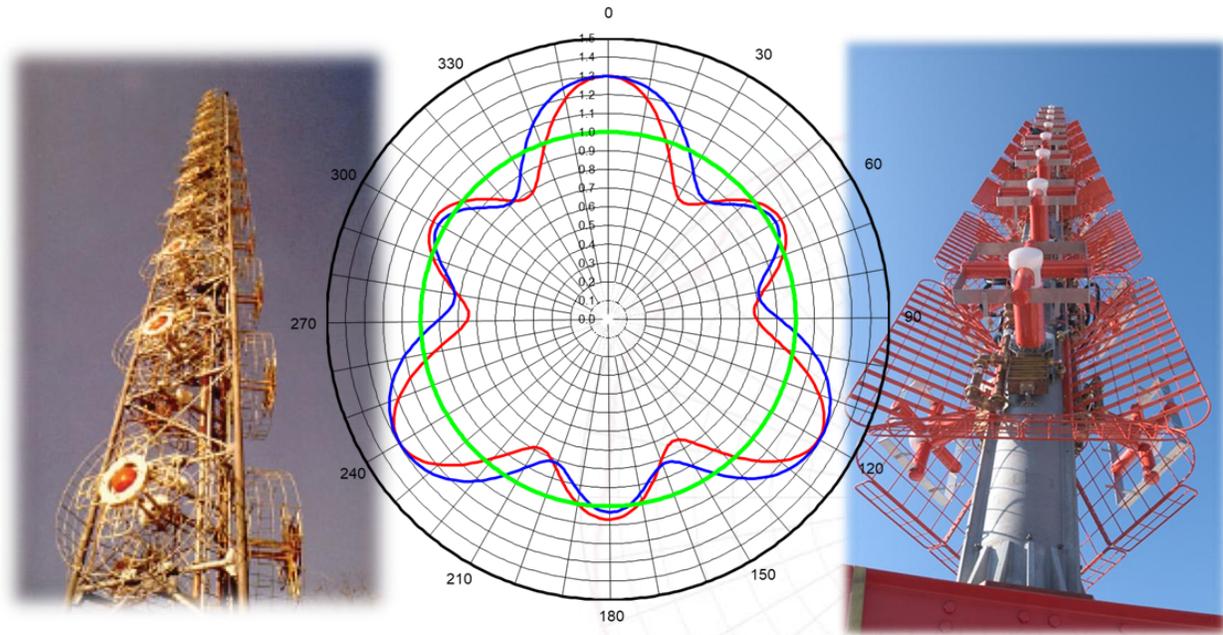

CIRCULARITY IMPROVEMENT

- Accomplished by adding dummy cylindrical lines around the antenna instead of a single line

Omni Directional Master FM Antenna

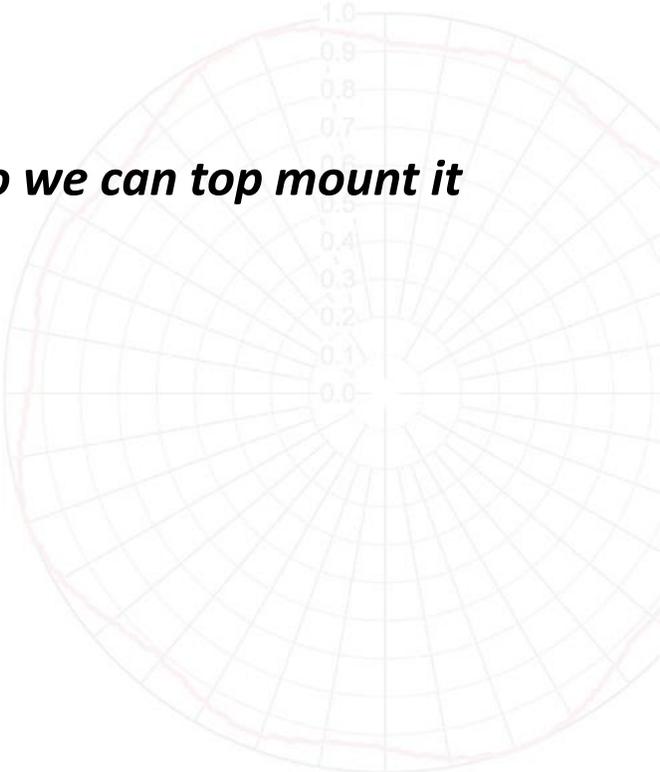

- What antenna choices are available today?
 - Panel style (CBR / HDCBR)
 - Pro's – Omni directional with excellent circularity
 - Con's – Complicated and expensive!
- Master Ring Style antenna
 - DCRU
 - Usually considered for master AUX
 - Pro's – Economical and reliable – High power handling
 - Con's – Side mounted - Circularity is compromised by tower effects

Trusted for Decades. Ready for Tomorrow.

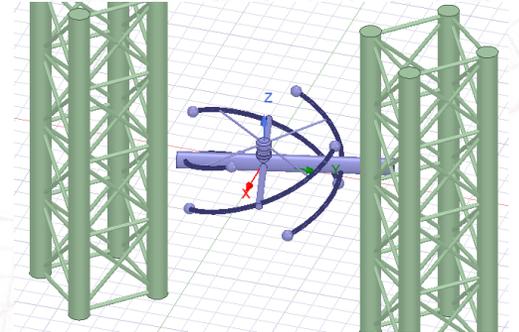

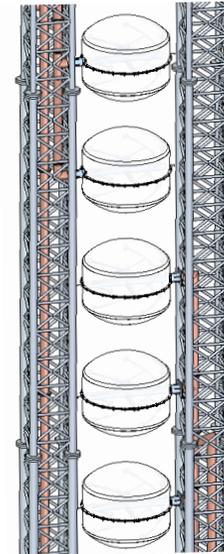

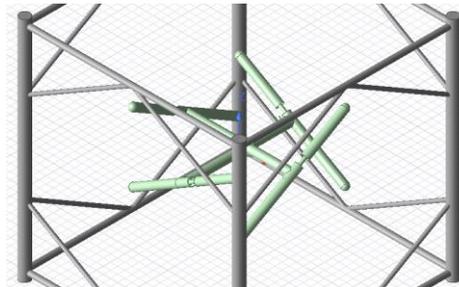

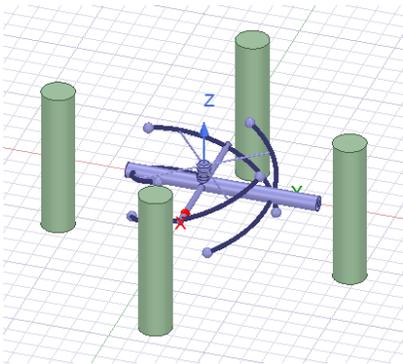

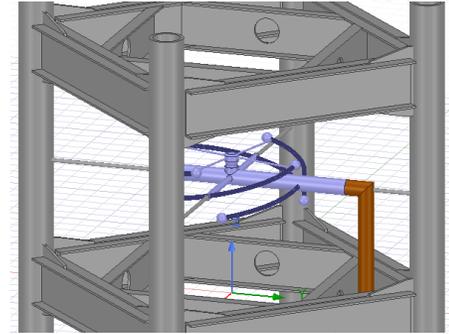

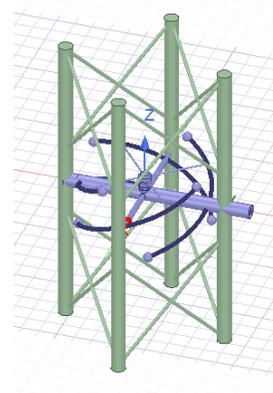

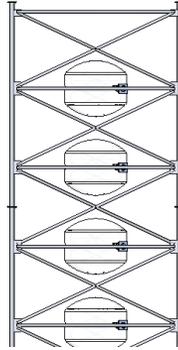

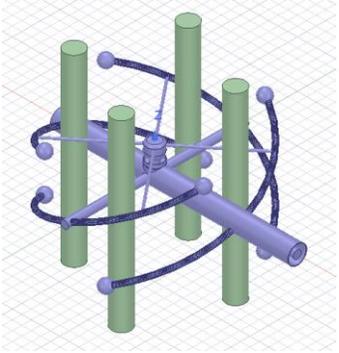

Sparking Innovation

What the industry needs is a ring style antenna that is not affected by a tower so we can top mount it

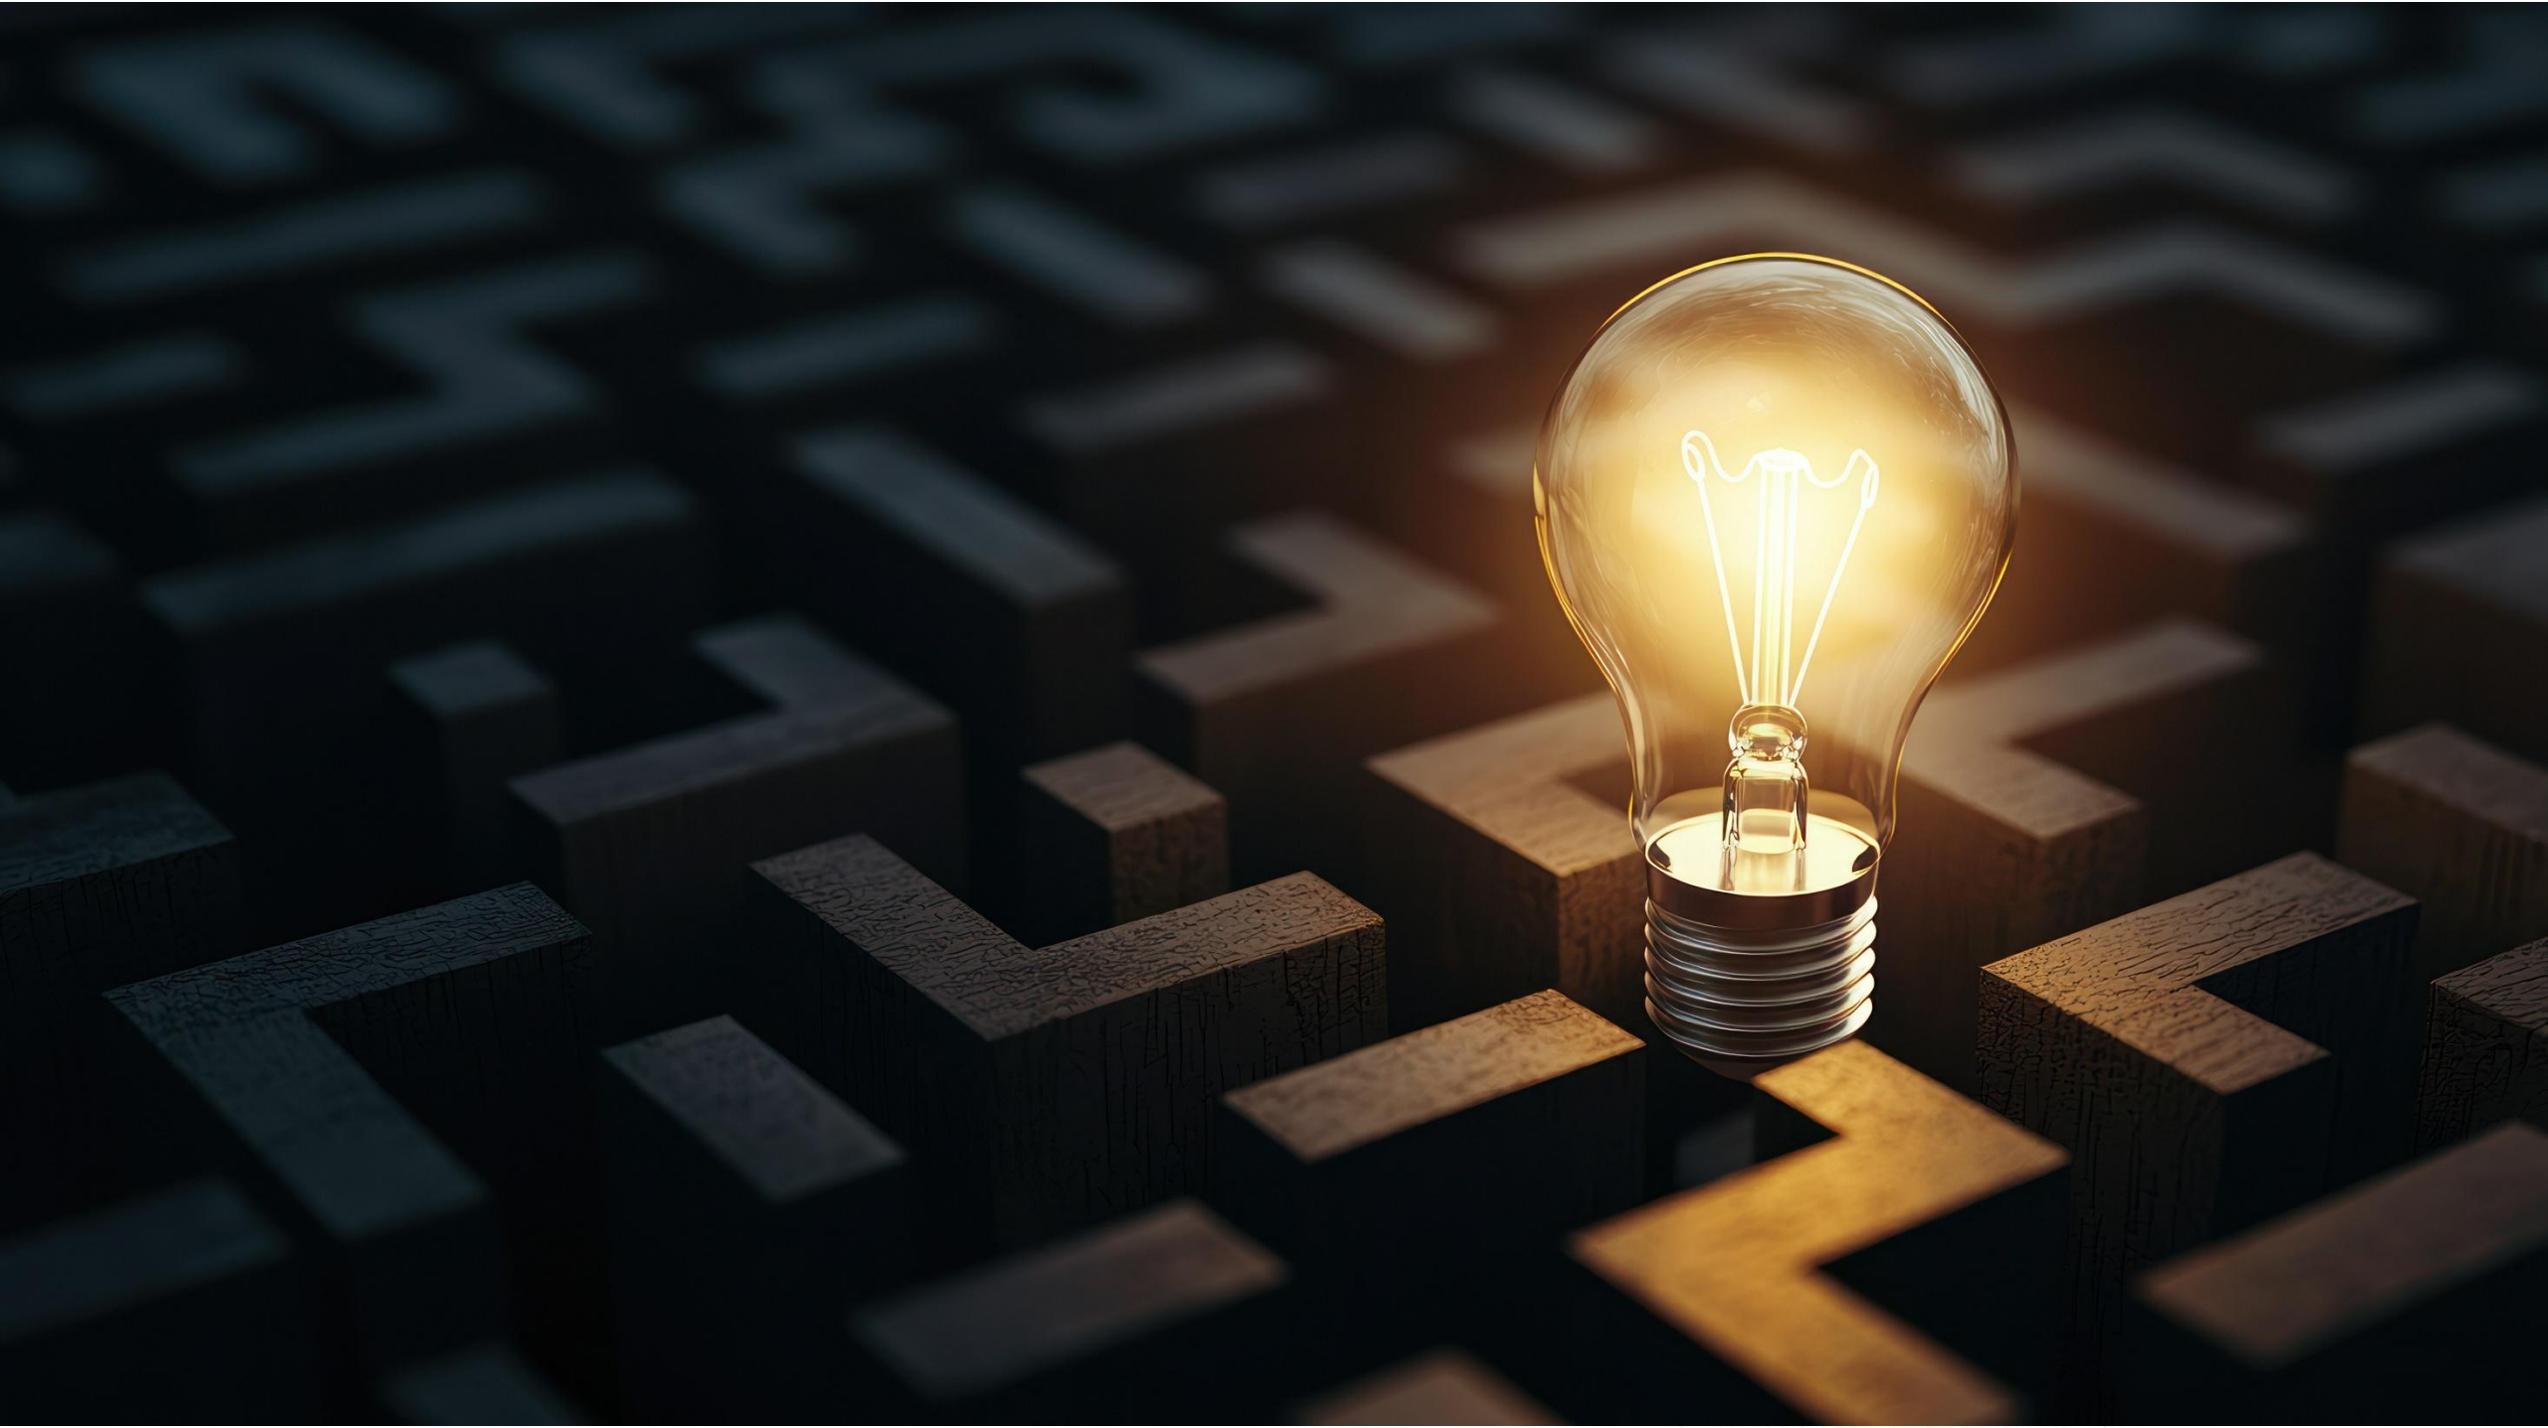

Failure Is Not An Option

- Failure is necessary
- We try...We fail...We learn...We adjust

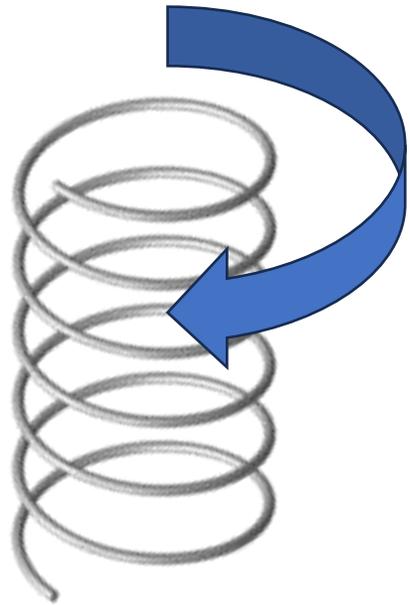

Trusted for Decades. Ready for Tomorrow.

Dielectric®

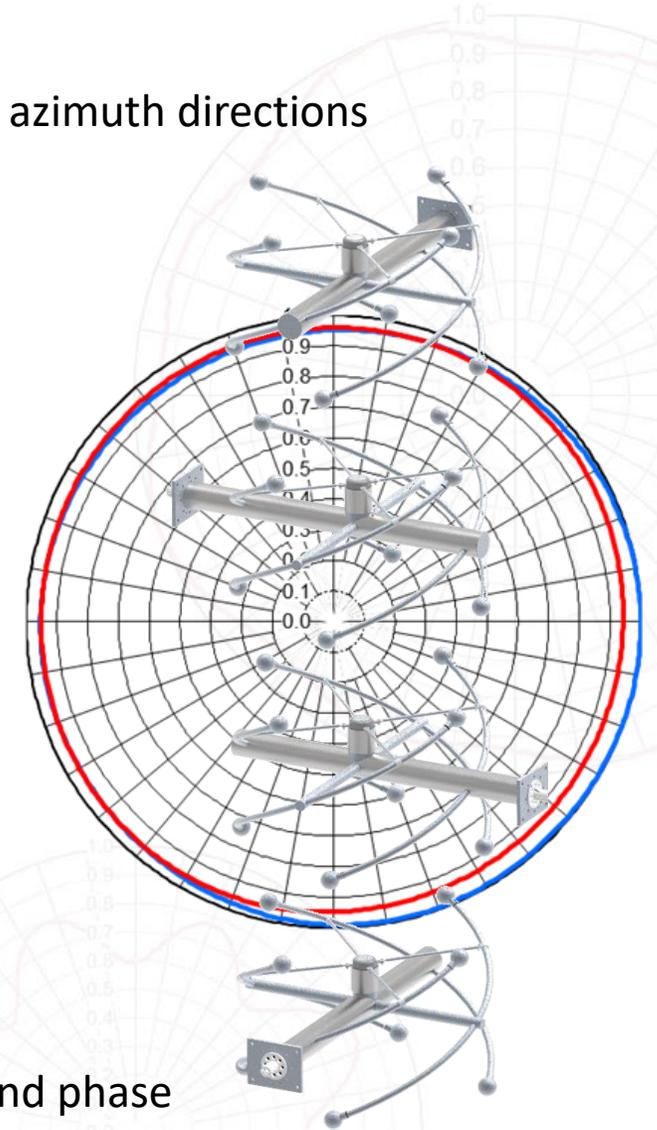

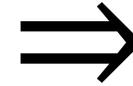

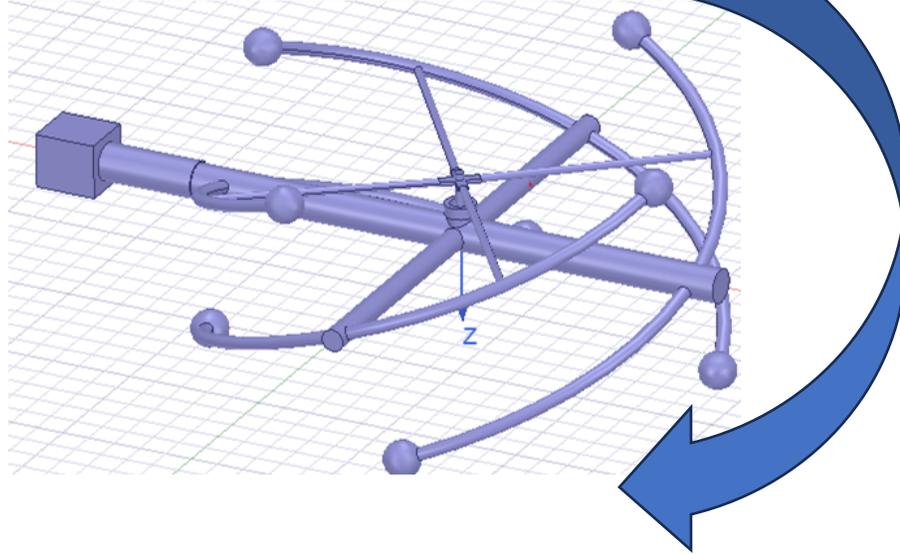

Helical Nature of a Ring Style Antenna

- The basic broadside helical antenna radiates equal amplitude and equal phase in all azimuth directions
- DCR ring style antennas are truncated helices

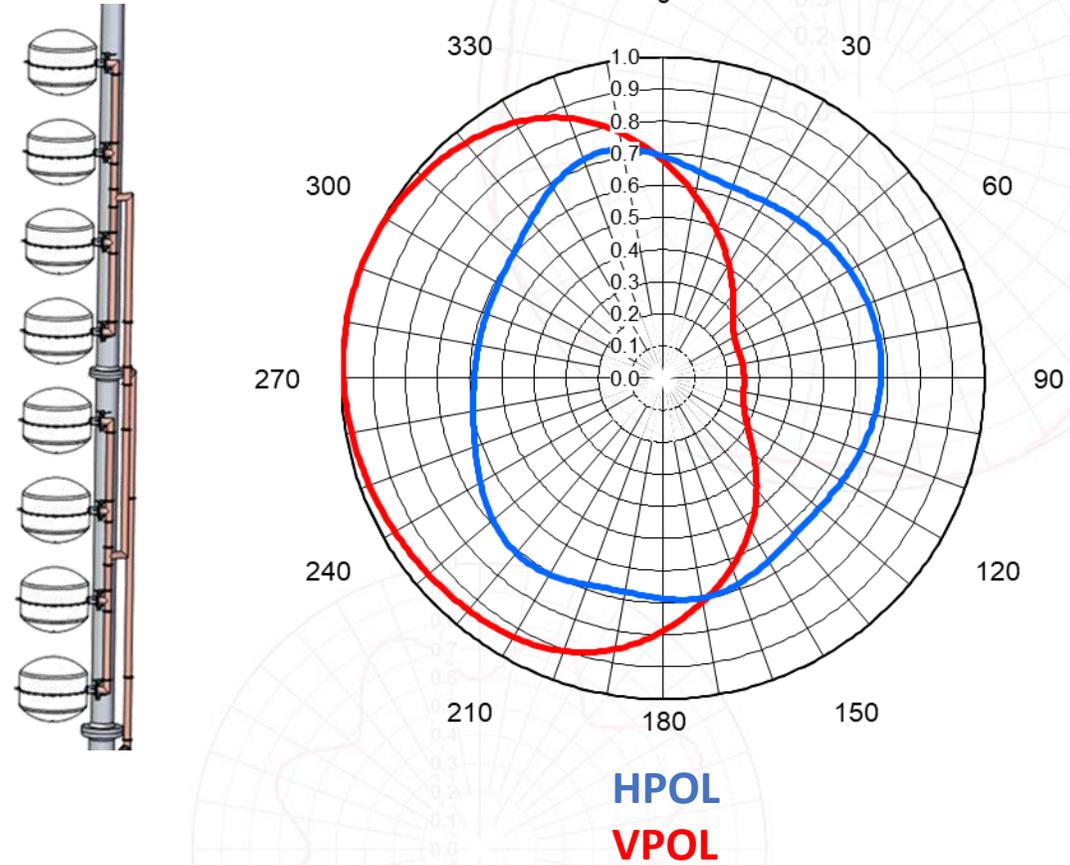

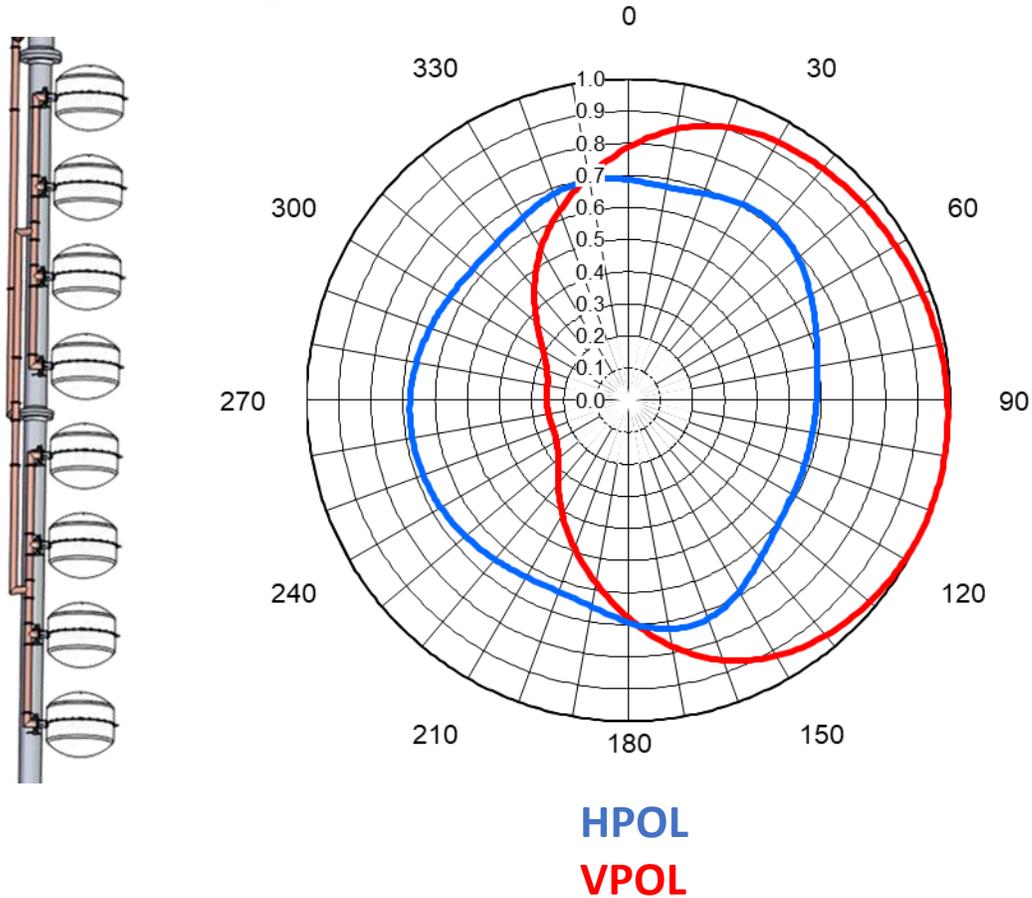

Equal amplitude and phase

- Bays can be rotated in any azimuth direction and the resulting radiated amplitude and phase will be the same

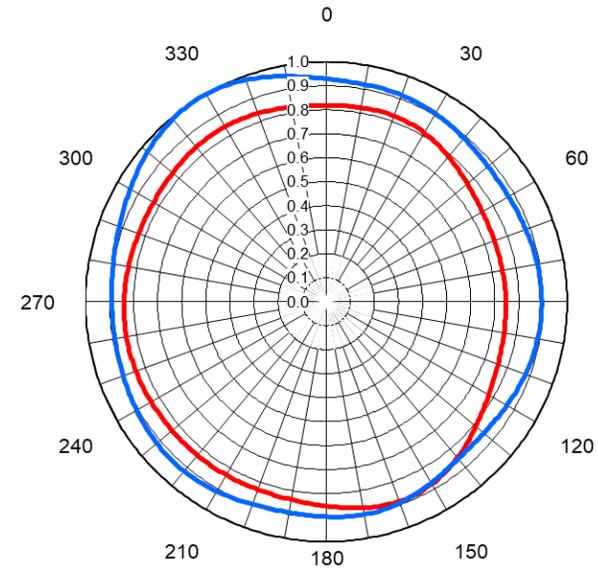

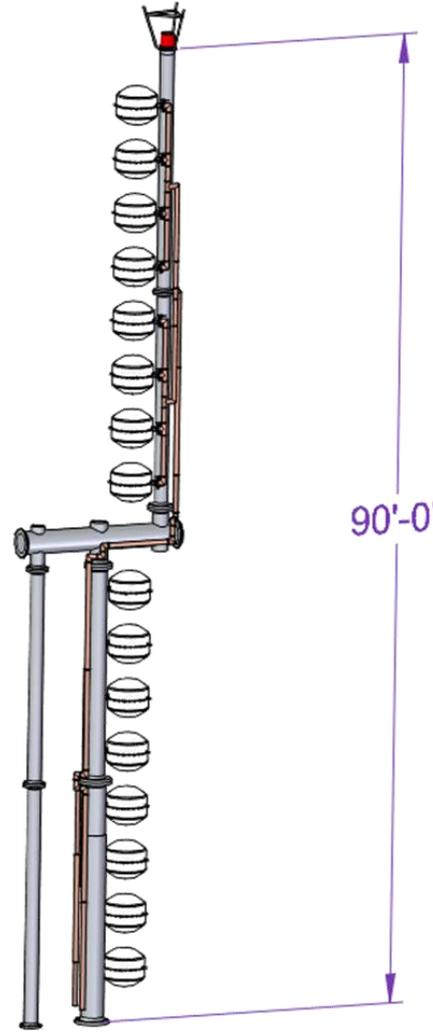

How Can This Feature Be Utilized?

- Two standard pole mounted ring antennas
 - Each produce an expected pattern on a large pipe
 - Facing in opposite directions

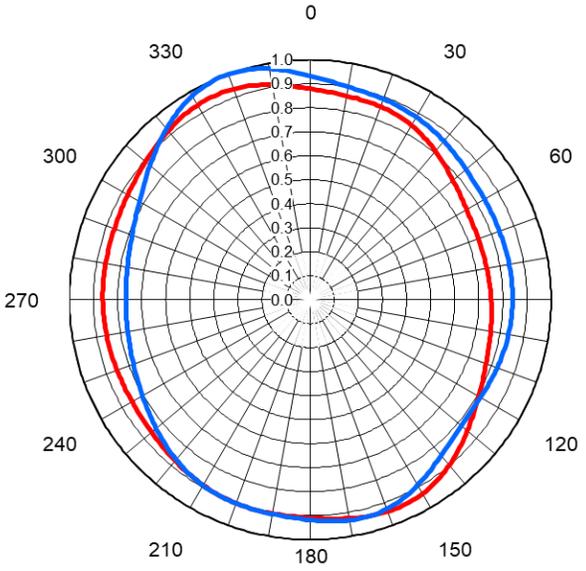

Adding the Two Together in a Mechanical Solution

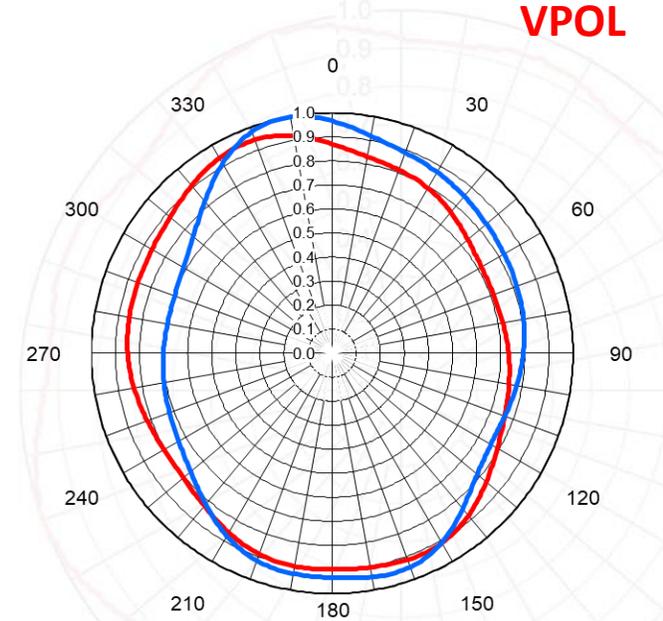

HPOL
VPOL

88 MHz

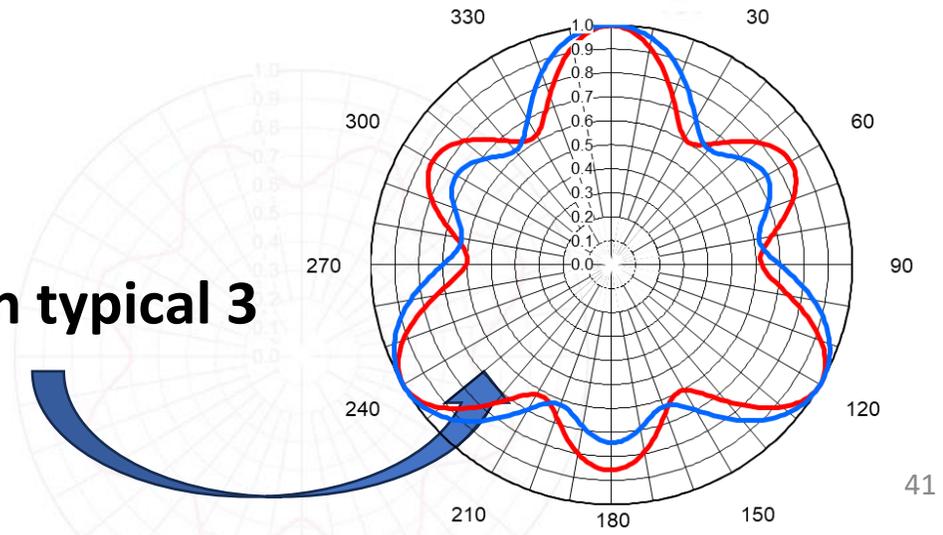

98 MHz

108 MHz

- Patterns incorporate
 - Real pipe sizes
 - Feed system
 - Mechanical counter pipe

Circularity better than typical 3 around panel!!!!

Trusted for Decades. Ready for Tomorrow.

Patent Pending

Mechanical Review of Ring360 Antenna Final Design Concept

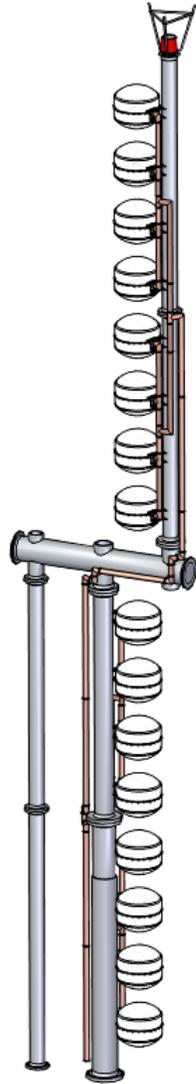

Offset Mast Design:

Balances the effect of the mast between the top and bottom halves.

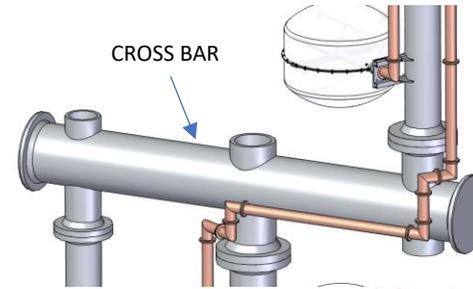

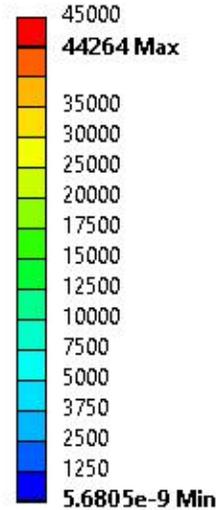

Mechanically this has proven to a sound solution.

Design leverages Dielectric's long experience with tubular pipe structures.

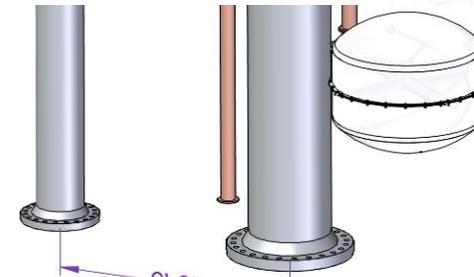

EPA = 272 ft²
(a comparable panel array is about 300 ft² **without** the support structure)

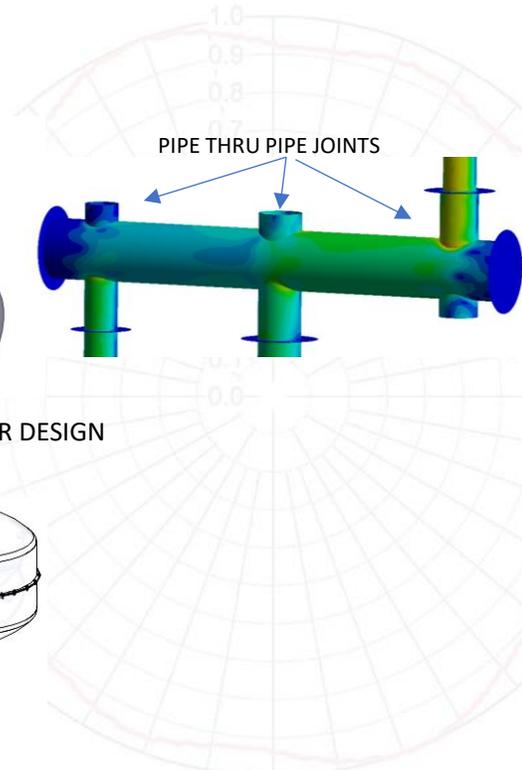

B: Static Structural
Equivalent Stress
Type: Equivalent (von-Mises) Stress - Top/Bottom
Unit: psi
Time: 1 s
5/29/2025 7:43 AM

CROSS BAR DESIGN

DUAL FLANGES AT TOWER TOP

PIPE THRU PIPE JOINTS

Unique challenges

Cross Bar design

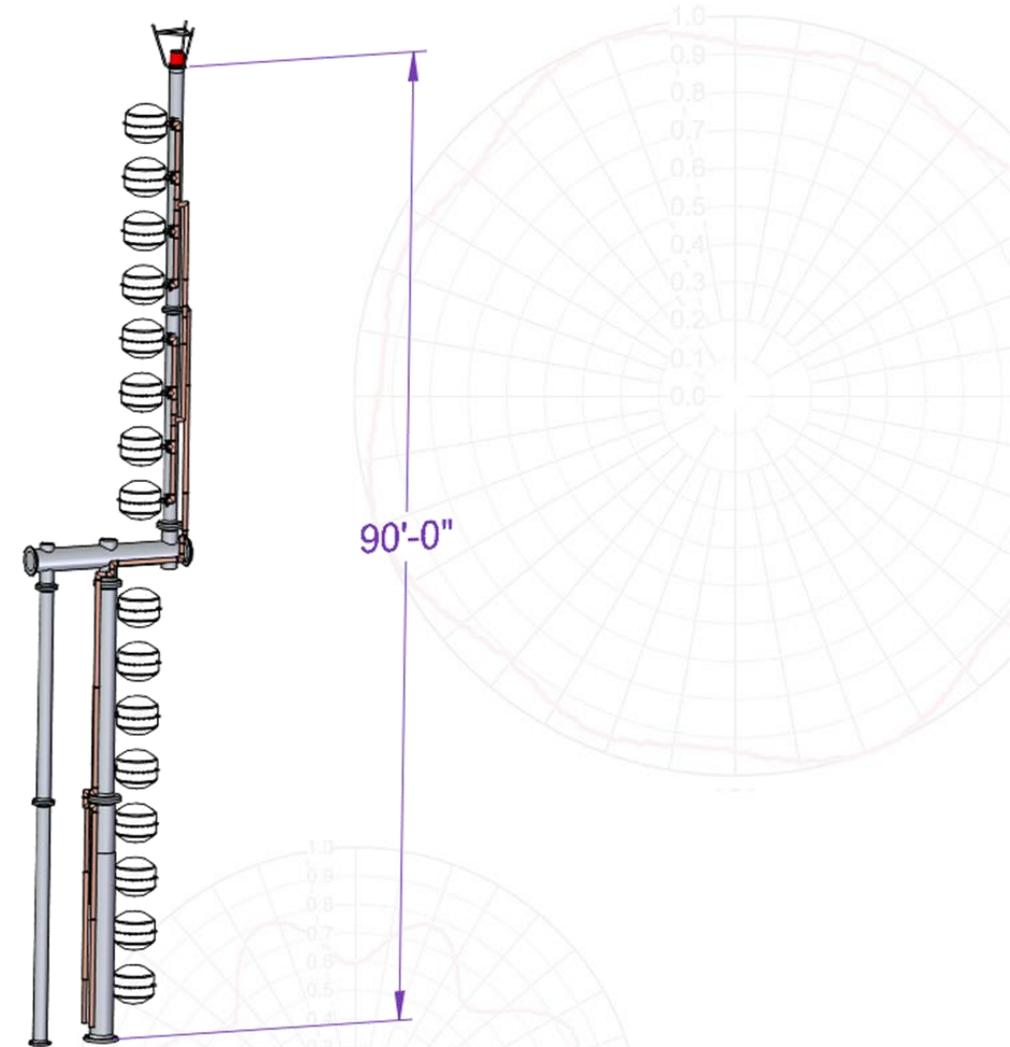

Dual flange tower mounting

Managing fabrication/install tolerances will be critical

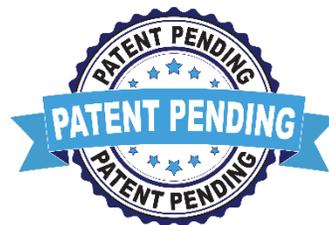

Ring360 Conclusions

The Ring360 antenna is:

- Simple solution to a complex problem
- Better performance than a panel array
- Much less complex than a panel array
 - Parts count directly proportional to reliability
 - 10X more reliable than a panel
- Adaptable to other antenna configurations
- 60% lower wind load compared to panel array antenna

Trusted for Decades. Ready for Tomorrow.
